NTI
BUILDING A SAFER WORLD

CONTENTS

ACKNOWLEDGMENTS

We are grateful to Nuclear Threat Initiative (NTI) Co-Chair Sam Nunn and Co-Chair and Chief Executive Officer Ernest Moniz for their leadership in reducing nuclear threats globally and to NTI President Joan Rohlfing for her important contributions to this global assessment. We also are grateful for our longstanding partnership with the Economist Intelligence Unit (EIU)—in particular Leo Abruzzese, Global Director of Public Policy; Hilary Steiner, Global Director, Public Policy Consulting; Robert Powell, Senior Consultant; and the EIU's global network of analysts.

We owe a deep debt of gratitude to our International Panel of Experts, which includes some of the most highly respected experts from around the world. They have been extremely generous with their time, and we have done our best to ensure that this report reflects their collective wisdom.

We also appreciate the many officials and experts from around the world who participated in briefings and who provided their critical insights to this fourth edition of the NTI Index. They include government officials who took the time to review and comment on the data gathered by the EIU, thereby helping to ensure that the NTI Index is as accurate and up to date as possible.

Additionally, we would like to thank the NTI Board of Directors for its support, and we give special thanks to NTI's generous funders, including the John D. and Catherine T. MacArthur Foundation, the Peter G. Peterson Foundation, the Robertson Foundation, and the Carnegie Corporation of New York.

Finally, we are indebted to all of our colleagues at NTI who provided invaluable contributions to the Index. In particular, we thank Mimi Hall and Carmen MacDougall of our communications team. We also thank Catherine Crary, Hope Fasching, Carter Bates, and Alexandra Van Dine for their valuable work. Without their support, the NTI Index would not be possible.

Building a Framework for Assurance, Accountability, and Action

FOREWORD

T
he news out of Belgium was chilling: within days of deadly terrorist bombings at the Brussels airport and subway, authorities dramatically increased security around the country's nuclear complexes, thus stripping workers of their security badges and sending most employees home. It was not a typical post-attack security crackdown. Authorities had reason to believe that an "insider" in Belgium might be helping Islamic State terrorists gain access to the country's nuclear and radiological materials.

Even before those 2016 suicide bombings in Brussels killed 35 and injured more than 300 others, concern had been growing across Europe and beyond as authorities uncovered evidence that well-organized, well-funded, increasingly capable terrorist organizations were seeking weapons of mass destruction. The evidence reinforces that we are racing the clock to prevent an attack with catastrophic consequences.

It has been clear for some time that governments struggle to stay ahead of—even to keep pace with—those evolving, escalating threats. That recognition—along with the understanding that the only way to address the greatest

security threats facing the world is for governments to work together—was the impetus for four global Nuclear Security Summits.

NTI's Nuclear Security Index, a biennial ranking of nuclear security conditions worldwide, was borne of the need to determine the steps that countries and the global community should take to strengthen security around nuclear materials and facilities and to evaluate progress against those steps.

The NTI Index has tracked that progress since 2012 (in tandem with the summits). Although the summit process is now over, the work it catalyzed has never been more important. This fourth edition of the NTI Index reflects the work that remains to be accomplished.

There are reasons for optimism. The 2018 NTI Index assesses nuclear security conditions in the 22 countries that have one kilogram or more of weapons-usable nuclear materials. Six years ago, 32 countries had such quantities, and we commend those countries (now including Argentina and Poland) that have addressed the threat in the best way possible: by removing or disposing of all their weapons-usable nuclear materials.

Foreword

In 2015, Belgian authorities arrested a man with ties to a terrorist group who tracked a senior researcher at a Belgian nuclear center that produced materials that could be used for a radiological "dirty bomb."

The 2018 NTI Index also finds that, since the 2016 report, countries have accelerated their work to mitigate the threat of theft or sabotage by improving physical protection at nuclear facilities, security during transport of materials, response capabilities, on-site cybersecurity, and more. Specific improvements are detailed in this report, including NTI's Theft Ranking (first released in 2012) and NTI's Sabotage Ranking (added in 2016), the latter of which tracks nuclear facilities' vulnerability to potential acts of sabotage.

At the same time, there are some unfortunate and alarming undercurrents. In the eight years since the first Nuclear Security Summit elevated the issue of nuclear security to the head-of-state level and promoted global cooperation on an issue that still too often is regarded as a sovereign matter, important progress made in the nuclear security realm is now in jeopardy.

Around the world, the overall risk environment is deteriorating, which makes progress challenging and potentially engenders backsliding. The Index's "Risk Environment" indicators identify a global increase in political instability, ineffective governance, pervasiveness of corruption, and the presence and capabilities of terrorist groups. And this news comes at a time when a growing list of countries—including in the Middle East, North Africa, and Central Europe—are developing ambitious new plans for nuclear power.

Countries made modest improvements in cybersecurity, but—overall—defenses remain dangerously insufficient to meet the expanding and rapidly evolving cyber threat. Governments and facility operators must step up their game to tackle the threats that exist on this front.

The results of this Index do not bode well for governments' ability to keep their attention focused on what always should be job one: protecting citizens from harm. Instead, the results serve to reinforce the need for countries to band together to develop an effective global nuclear security system with the following: a common set of international standards and best practices, a mechanism for holding countries accountable for appropriate and effective security measures, and a robust legal foundation for securing nuclear materials.

That approach has been NTI's top-level recommendation from the start, and it remains so today. In the face of emerging and escalating global threats, we believe leaders have an obligation to recommit to the security agenda laid out at the Nuclear Security Summits and to take tangible, measurable steps to protect against terrorist attacks that could have almost unfathomable consequences.

Building a Framework for Assurance, Accountability, and Action

EXECUTIVE SUMMARY
Progress in Nuclear Security Jeopardized by Deteriorating Risk Environments

After years of progress on nuclear security and continued improvements following the last of four global Nuclear Security Summits, the preventive measures countries have taken to secure nuclear materials against theft by terrorist organizations are at risk. The 2018 NTI Nuclear Security Index finds that, since 2016, risk environment factors (including political instability, ineffective governance, pervasiveness of corruption, and presence of groups interested in illicitly acquiring nuclear materials or in committing acts of nuclear terrorism) have deteriorated in 54 countries. Such deterioration has occurred at a time when well-organized, well-financed, and increasingly capable terrorist organizations are actively seeking the materials necessary to build weapons of mass destruction; additionally, cyber threats to nuclear facilities are rapidly expanding and evolving.

Today, 22 countries around the globe have weapons-usable nuclear materials, and 44 countries and Taiwan have nuclear facilities for which an act of sabotage could result in a dangerous release of radiation. Among those countries that the 2018 NTI Index identifies as having deteriorating risk environments, seven are estimated to have nearly 1,000 metric tons of weapons-usable nuclear materials combined,[1] and 12 countries with deteriorating risk environments have a total of more than 120 nuclear sites.[2]

From 2010 to 2016, the global Nuclear Security Summits, where heads of state came together biennially to address nuclear security, elevated the importance of the issue, sharpened understanding of the steps needed to prevent catastrophic terrorism, and prompted countries to make commitments both big and small to improve the security of potentially vulnerable nuclear materials and

Executive Summary

KEY TRENDS FROM THE 2018 NTI INDEX

› Countries have accelerated nuclear security improvements.

› Deteriorating risk environments jeopardize progress.

› Defenses against the cyber threat remain insufficient.

› States without nuclear materials actively support global nuclear security norms.

facilities. Those summits ended in 2016, however, and no comparable cooperative global effort has emerged to replace them. Meanwhile, both the terrorist threat and new concerns, including the risk of cyberattacks on nuclear facilities, are mounting. This fourth edition of the NTI Index provides a benchmark that leaders can use to judge progress, and it contains recommendations for enhancing the security of nuclear materials and facilities around the world in an ever-more perilous context.

ABOUT THE NTI NUCLEAR SECURITY INDEX

The 2018 NTI Nuclear Security Index assesses the security around of some of the world's deadliest materials (highly enriched uranium and plutonium that can be used to build nuclear weapons), as well as the security of nuclear facilities, which, if sabotaged, could lead to dangerous releases of radiation. Developed in 2012 with the Economist Intelligence Unit (EIU) and guided by an international panel of respected nuclear security experts, the NTI Index tracks country-level progress on nuclear

security and encourages governments to take actions to protect and build confidence in the security of their materials and facilities.

The 2018 NTI Index ranks nuclear security conditions in 22 countries that possess one kilogram or more of weapons-usable nuclear materials, 154 countries with less than one kilogram of or no weapons-usable nuclear materials,[3] and 44 countries and Taiwan where an act of sabotage against a nuclear facility could lead to a dangerous radiation release.[4]

KEY TRENDS FROM THE 2018 NTI INDEX

Countries have accelerated improvements to secure, minimize, and eliminate weapons-usable nuclear materials, as well as to secure nuclear facilities that could be sabotaged. However, challenging risk environments may jeopardize those improvements.

› **Countries Have Accelerated Nuclear Security Improvements.** Since 2012, 10 countries have eliminated their stocks of nuclear materials. In addition, since 2016, countries with weapons-usable nuclear materials have taken 82 specific actions to improve nuclear security conditions.[5] Of the 44 countries and Taiwan with nuclear facilities, 78 percent improved their NTI Index Sabotage Ranking scores, which is attributable in part to notable improvements in security and control measures, including on-site physical protection of nuclear sites, enhanced insider threat prevention measures, and improved response capabilities.

› **Deteriorating Risk Environments Jeopardize Progress.** The EIU's Risk Environment ratings for nuclear security in the 2018 NTI Index offer cause for concern. Political instability, ineffective governance, pervasiveness of corruption, and the presence and

---

[3] Countries without weapons-usable nuclear materials are assessed across a subset of the framework that considers their contribution to global nuclear security. For information on Taiwan's status and its treatment in the NTI Index, see the full EIU Methodology at www.ntiindex.org.

[4] Countries measured in the Sabotage Ranking have nuclear facilities subject to sabotage, including nuclear reactors for power generation, research, or both.

[5] NTI's analysis of actions that countries have taken to improve their nuclear security conditions measures score improvements at the subindicator level, counting a country's positive score change on an Index subindicator as a single improvement. The total number of actions does not describe the magnitude of those actions, nor does it describe those actions' impact on the overall country score or ranking.

capabilities of terrorist groups resulted in declining Risk Environment scores. At the same time, scores declined for almost as many countries as improved between 2016 and 2018, including 7 of the 22 countries with weapons-usable nuclear materials and 12 of the 44 countries and Taiwan with nuclear facilities.[6] Risk environment factors have the potential to adversely affect other measures that are designed to ensure that a country's nuclear materials and nuclear facilities are secure.

> **Defenses against the Cyber Threat Remain Insufficient.** Although countries have made modest improvements, many remain poorly prepared to defend against cyberattacks. Among the countries and Taiwan that have weapons-usable nuclear materials or nuclear facilities, one-third lack all of the basic cybersecurity regulations measured. Since 2016, only 12 countries have improved their cybersecurity regulations, and only 12 countries and Taiwan that have weapons-usable nuclear materials or nuclear facilities were given full credit, confirming that the country has put in place the basic cybersecurity regulations measured by the NTI Index.[7]

> **States without Nuclear Materials Actively Support Global Nuclear Security Norms.** To prevent the transit of illicit nuclear materials through their territories and to prevent their domains from being used as staging grounds for malicious activity, countries without weapons-usable nuclear materials continue to support global nuclear security norms. Since 2016, 22 additional countries have ratified the 2005 Amendment to the Convention on the Physical Protection of Nuclear Materials (CPP), reinforcing the international legal foundation for nuclear materials security.[8]

IMPERATIVES FOR IMPROVING NUCLEAR SECURITY CONDITIONS

An effective global nuclear security system that ensures the protection of vulnerable nuclear materials and facilities remains elusive. In the absence of such an agreed upon and comprehensive system, the notable progress that countries have made in reducing the risk of nuclear terrorism is in jeopardy. Meanwhile, demand for nuclear energy is growing around the world, leading new countries to consider taking on the associated risks and responsibilities.

In the absence of the Nuclear Security Summits, government leaders must stay focused on ensuring the security of some of the world's most dangerous materials and nuclear facilities. Government officials, as well as those in charge of nuclear facilities, also must address expanding and evolving risks (such as those posed by the cyber threat) and must work to enhance the resiliency and security of nuclear facilities. This is particularly important at a time of heightened political instability and terrorist risks. To prevent the theft of weapons-usable nuclear materials or catastrophic attacks on nuclear facilities, national leaders should:

> **Build an Effective Global Nuclear Security System.** Common international standards, a mechanism for holding states accountable, and a comprehensive international legal foundation are required. Countries should:

→ Bolster the international legal foundation for nuclear security, and take advantage of the 2021 review conference of the Convention on the Physical Protection of Nuclear Materials and Nuclear Facilities, which will provide a forum for ongoing global engagement to address critical gaps.

→ Strengthen and build confidence in the security of all materials, both civilian and military. Countries should commit to securing nuclear materials used

---

[6] Notably, between 2016 and 2018, risk environments declined more in countries with weapons-usable nuclear materials than they did in the period of 2014–2016.

[7] Countries and Taiwan receiving full credit include Australia, Belarus, Canada, Finland, France, Germany, Hungary, the Netherlands, Romania, South Korea, Taiwan, the United Kingdom, and the United States.

[8] The official name of the amended Convention on the Physical Protection of Nuclear Materials (CPPNM), now entered into force, is the Convention on the Physical Protection of Nuclear Materials and Nuclear Facilities. This report refers to the amended Convention, which incorporates the 2005 Amendment, as the "CPP." The NTI Index subindicators assess whether countries have signed or ratified those legal instruments.
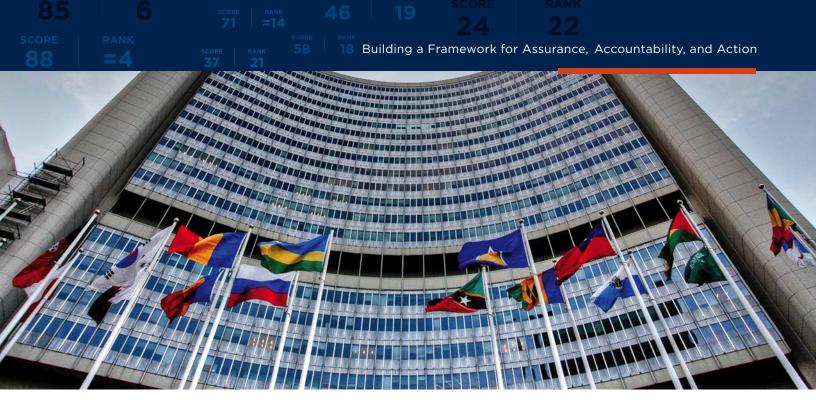

for military purposes to the same or higher standards as those used for peaceful activities.

→ Build international confidence in the effectiveness of nuclear security and strengthen the International Atomic Energy Agency's (IAEA) role and capacity. Countries should demonstrate their commitment to boosting confidence in nuclear security by participating in international peer reviews, declaring overall quantities of nuclear materials, making voluntary commitments to share best practices, and supporting an enhanced role for the IAEA in promoting nuclear security.

› **Defend against the Growing Risk of Cyberattack.** Cyberattacks could facilitate the theft of nuclear materials or an act of sabotage, potentially resulting in catastrophic health consequences to the public. Effective cybersecurity measures must be incorporated into government regulations and facility operations. Countries and facilities should:

→ Promote and invest in continuous improvement of cybersecurity protections. While nuclear operators struggle to prioritize cybersecurity efforts, today's cyber threat continues to evolve, outpacing defenses and regulations in many states. Dedicated efforts are needed to embed cybersecurity best practices into the culture of nuclear facilities.

→ Build mutual assistance mechanisms and shared resources for responding to cyberattacks. A cyberattack could be launched against a facility anywhere in the world, with lasting global consequences for the nuclear industry. Working collaboratively to ensure a rapid and effective response to a serious cyberattack on a global level allows countries—whether those with mature nuclear programs or emerging ones—to minimize the potential consequences.

→ Increase the quality and number of cyber-nuclear experts. The global competition for cybersecurity talent is fierce, and developing, maintaining, and retaining the necessary capacity in every country with nuclear facilities will be difficult. States and nuclear facility leaders should consider developing alternative means of filling talent gaps, such as mutual support agreements and investing in the skill development of current workers.

› **Improve State Stewardship of Nuclear Materials and Facilities.** The four Nuclear Security Summits held between 2010 and 2016 assembled world leaders to focus global attention on the critical importance of securing nuclear materials and facilities. Through national commitments, countries took actions to reduce the chance that nuclear materials could be stolen or facilities sabotaged. However, the job of securing all weapons-usable nuclear materials is far from finished. Countries should:

→ Commit to further decreasing stocks and applications that require use of weapons-usable nuclear materials. The more material and sites, the greater the exposure to risk of theft. All countries should work to minimize their use of weapons-usable nuclear materials, and they should reduce or eliminate stockpiles of those materials where possible.

→ Improve core security and control measures. Despite progress, critical gaps remain in the protection of nuclear materials and facilities. Countries should prioritize the strengthening of security cultures and should work continually to enhance security measures at nuclear facilities.

→ Reduce political risks that can undermine nuclear security. Countries should not overlook other risk factors that exacerbate the threats to nuclear materials and facilities. Countries with risk factors such as high levels of corruption or weak governance practices should intensify their efforts to ensure that their materials and facilities are highly secured.

This report outlines the key trends, country highlights, recommendations, rankings, and country-level data of the NTI Nuclear Security Index, Fourth Edition. More information, including opportunities to explore the data and recommendations for action, is available at www.ntiindex.org.

Building a Framework for Assurance, Accountability, and Action

OBSERVATIONS

The 2018 NTI Nuclear Security Index finds that progress to secure, minimize, and eliminate weapons-usable nuclear materials (as well as to ensure the security of nuclear facilities) has accelerated since 2016. Since 2012, when NTI began tracking countries' nuclear security conditions and released the first biennial NTI Index, 10 countries have eliminated their stocks of materials, and more countries have taken deliberate, national actions to improve the security of their nuclear facilities.

At the same time, such progress may be jeopardized amid the deterioration of political stability and effective governance, an increase in corruption, and the expanding presence and capabilities of terrorist groups around the world. Even in countries with long-standing nuclear programs, the risk environment for nuclear security is causing new alarm: terrorist activity in Europe and the Middle East, social unrest in developed democracies, and international disputes all raise the prospect for theft of weapons-usable nuclear materials or sabotage of nuclear facilities.

Not only do the data gathered for this fourth edition of the NTI Index show how countries have steadily improved their

nuclear security conditions, they also illustrate the need for renewed attention and commitment to risk reduction.

The following observations include key trends and select country-level highlights.

KEY TRENDS

Countries Have Accelerated Nuclear Security Improvements

In many countries, national commitments have been made to support broad-based improvements to nuclear security conditions. Among other improvements, two fewer countries hold nuclear weapons-usable materials than did in the 2016 NTI Index, and 13 countries have made important improvements to the ways in which they secure materials stocks.

› Since the 2016 NTI Index, two additional countries, Argentina and Poland, removed or disposed of all highly enriched uranium within their territories. They join Austria, the Czech Republic, Hungary, Mexico, Sweden, Ukraine, Uzbekistan, and Vietnam—all of which similarly cleaned out their materials stockpiles between 2012

Observations

THEFT RANKING
Countries with Weapons-Usable Nuclear Materials

Rank / 22		Score / 100	Change since 2016	Change since 2012	Rank / 22		Score / 100	Change since 2016	Change since 2012

3	Canada	89	+2	+10	=14	China	71	+11	+14
=4	Germany	88	+5	+11	=14	Kazakhstan	71	+5	+5
=4	Japan	88	+10	+22	16	South Africa	70	-1	+2
6	Norway	85	+2	+7	17	Russia	67	+3	+5
=7	Belarus	84	+1	+10	18	Israel	58	+3	+4
=7	Netherlands	84	+5	+5	19	India	46	+1	+4
=9	Belgium	81	-2	+11	20	Pakistan	44	+4	+8
=9	Italy	81	+6	+9	21	Iran	37	+2	+2
11	France	80	0	+3	22	North Korea	24	0	-4
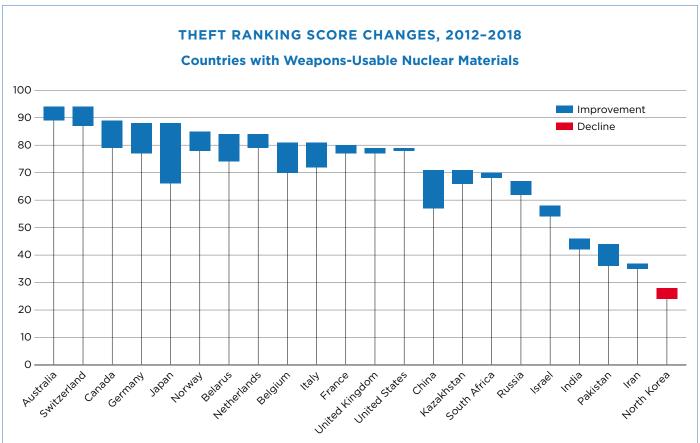

= denotes tie in rank.

and 2016. The total number of countries with weapons-usable materials is now 22, down from more than 50 in the early 1990s and more than 40 in the early 2000s. The elimination of those materials reduces opportunities for interested terrorists and criminals to obtain weapons-usable nuclear materials.

› Between 2016 and 2018, as measured by the NTI Index, countries with weapons-usable nuclear materials took a total of 82 actions[9] to improve nuclear security conditions, compared with 43 that were taken during the prior two-year period. Those actions include improvements to the core protection and control measures assessed in the NTI Index, such as (a) on-site physical protection, (b) control and accounting procedures, (c) mitigation of threats from within nuclear facilities (i.e., the risk that personnel with authorized

access to materials could steal weapons-usable nuclear materials and/or potentially aid the terrorists or criminals who wish to obtain them), (d) physical security during transport, (e) response capabilities, and (f) cybersecurity of nuclear facilities.

› Countries that still maintain stocks of weapons-usable nuclear materials—highly enriched uranium, separated plutonium, or fresh mixed-oxide fuel—accelerated the pace of their security improvements since 2016. Of the core protection areas measured in the NTI Index, countries made 30 tangible improvements since 2016, the majority of which were improvements to basic protection and security regulations such as insider threat prevention measures and physical security of materials during transport.[10] This progress compares to the 21 improvements countries made during the prior two-year period, 20 of which were improvements to

---

9   NTI's analysis of the actions that countries took to improve nuclear security conditions measures score improvements at the subindicator level and counts a country's positive score change on an Index subindicator as a single improvement. The total number of actions does not describe the magnitude of those actions, nor does it describe their effect on a country's overall score or ranking.

10 "Core protection area" indicators refer to the NTI Index's second category of indicators for countries with weapons-usable materials or nuclear facilities. The category evaluates on-site physical protection, control and accounting procedures, insider threat prevention, physical security during transport, response capabilities, and cybersecurity.

Observations

THEFT RANKING SCORE CHANGES, 2012–2018

Countries with Weapons-Usable Nuclear Materials

Of countries with weapons-usable nuclear materials, only North Korea declined in its Theft Ranking score. The height of each bar indicates the total score change between 2012 and 2018.

cybersecurity measures.[11] In fact, of the 22 countries with weapons-usable nuclear materials, 16 improved their overall Theft Ranking score between 2016 and 2018. Those improvements include:

➔ Reducing opportunities for theft. Since 2016, six countries took steps to reduce their quantities and sites of fissile materials.[12] Four countries, however, increased their quantities of weapons-usable nuclear materials.[13] The more materials and sites a country has, the greater its exposure to risk of theft.

➔ Strengthening physical protection measures. Three countries took actions to improve physical security[14] and five countries passed new laws or regulations to mitigate the insider threat.[15] Such steps reduce the risk that personnel with authorized access could steal nuclear materials and/or potentially aid terrorists or criminals.

➔ Improving the physical security of materials during transport. Five countries improved regulations dealing with the protection of nuclear materials when

---

[11] The 2016 figures may differ from those published in the 2016 NTI Nuclear Security Index report as a result of backscoring or government data clarification. See full details about the methodology at www.ntiindex.org.

[12] Listed in order of improvement from greatest to least: Japan, the Netherlands, Switzerland, Kazakhstan, Belgium, and Germany.

[13] India, North Korea, Pakistan, and the United Kingdom.

[14] Australia, Kazakhstan, and Pakistan.

[15] Canada, China, Germany, Japan, and Pakistan.

Observations

they are being moved and are most vulnerable to theft.[16]

➔ Improving response capabilities. Three countries took steps to improve response capabilities which are part of a layered security system that can help authorities recover materials should they be stolen from a site.[17]

➔ Making international legal commitments to nuclear materials security. Two countries signed on to either the 2005 Amendment to the International Convention on the Physical Protection of Nuclear Materials (CPP) or the International Convention for the Suppression of Acts of Nuclear Terrorism (ICSANT).[18]

➔ Making commitments to nuclear materials security. Three countries made new voluntary commitments in the form of bilateral or multilateral assistance, contributions to the International Atomic Energy Agency's (IAEA) Nuclear Security Fund, or creation of new Centers of Excellence.[19]

➔ Building international confidence in security arrangements. Three countries hosted international security peer reviews.[20] Peer review is a powerful tool for improving security performance and for building others' confidence in a state's commitment to continued improvement.

❯ Of the countries and Taiwan with nuclear facilities that were assessed in the Sabotage Ranking, more than three-fourths improved their scores since 2016 (the inaugural year of the ranking). Particularly notable

improvements were made in the category of Security and Control Measures.

➔ Three countries improved their on-site physical protection of nuclear sites.[21]

➔ Four countries improved their control and accounting procedures by passing new laws or regulations requiring that potential levels of radiation released as a result of sabotage help determine how to physically protect nuclear materials,[22] equipment, systems, and devices,[23] or by requiring identity verification and recordkeeping of those entering restricted areas in nuclear facilities.[24]

➔ Eight countries improved insider threat prevention measures, including by enhancing the guidelines for the qualification and fitness of personnel with access to protected areas,[25] by improving the frequency of personnel vetting,[26] by requiring personnel to report suspicious behavior,[27] and by performing constant surveillance to detect unauthorized actions.[28]

➔ Four countries enhanced their response capabilities by requiring on-site armed guards,[29] by training law enforcement officers to respond to security incidents at nuclear facilities,[30] and by requiring plans for protection of nuclear infrastructure in the event of a natural disaster.[31]

More than half of all countries in the Sabotage Ranking, however, still have total scores below 80 out of a possible 100, indicating substantial opportunities for improvement.

Deteriorating Risk Environments Jeopardize Progress

Increases in political instability, ineffective governance, pervasiveness of corruption, and presence and capabilities of terrorist groups led to declining Risk Environment scores in almost as many countries as had improved between 2016 and 2018. Those results indicate cause for concern about the future of nuclear security in virtually every region of the world.

› In 7 of the 22 countries with weapons-usable nuclear materials, Risk Environment scores declined since 2016. Slight improvements to political stability and governance in 11 countries with weapons-usable materials[32] were matched or exceeded by declines in 7 other countries where social unrest, ineffective governance, pervasiveness of corruption, and terrorist risks increased.[33]

› In one-fourth of the countries where an attack on a nuclear facility could cause a dangerous release of radiation, Risk Environment scores declined since 2016. In 12 of the 44 countries and Taiwan with nuclear facilities at risk of sabotage, risk environment factors declined. Among countries with nuclear facilities, Risk Environment scores deteriorated most significantly in Belgium, Poland, and the United States.

→ In Belgium, news reports revealed that terrorist groups targeted nuclear facilities in the country precisely at a time when growing labor tensions and strikes had exacerbated government coordination problems.[34]

Observations

WHAT IS THE "RISK ENVIRONMENT" FOR NUCLEAR SECURITY?

The NTI Index takes a holistic view of nuclear security, including a Risk Environment category that measures indicators of political stability, effective governance, the pervasiveness of corruption, and whether there are groups in the country interested in and capable of illicitly acquiring nuclear materials. Such factors have the potential to affect measures designed to ensure that a country's nuclear materials and facilities are secure.

Political stability and effective governance underpin the management, security, and control of nuclear materials and facilities. High levels of corruption can lead to the compromise of security measures.

The presence of a terrorist or criminal group in a country and its interest in illicitly acquiring weapons-usable nuclear materials or in committing acts of nuclear terrorism affect a country's risk context for nuclear security. Although publicly available information in this area is limited, the EIU reviews various secondary sources and applies a gradient scale to rate the relative capabilities and intent of known groups in each country.

To develop country scores in the Risk Environment category, the EIU also relies on proprietary information contained in its Risk Briefing and Business Environment Ranking reports. Those reports are updated quarterly and take into account both present conditions and future expectations. Information on the presence of relevant terrorist groups is developed by EIU analysts, who build on information provided by the National Consortium for the Study of Terrorism and Responses to Terrorism at the University of Maryland. Additional information is available in the NTI Index Methodology Appendix.

→ In Poland, Risk Environment scores were adversely affected by social unrest in response to the governing party's reform agenda and social divisions within the country. Increased political control over the selection of judges sparked protests and led to increased tensions with the European Union. Significant social unrest can affect a government's ability to secure nuclear materials and can provide opportunities for groups seeking to acquire nuclear materials or access to nuclear facilities.

→ In the United States, Risk Environment scores declined on two indicators: political stability and effective governance. The EIU judged

those indicators to be deteriorating as a result of heightened social unrest, resignations and vacancies from key government departments, and the increasingly deep polarization of political party politics (which contributes to a country's ability to establish and sustain policies to secure nuclear materials).

› Political instability is a heightened risk factor for countries in the Sabotage Ranking. The potential for social unrest has increased in seven countries.[35] Instability and conflict associated with a change of power have increased in two countries and may provide opportunities for groups seeking to commit acts of

Observations

sabotage against nuclear facilities.[36] International tensions and disputes are expected to have destabilizing implications for nuclear security in four countries and Taiwan.[37] The potential for violent labor or civil demonstrations that could undermine government control has increased in two countries since 2016 as a result of protests against institutional reforms, security, or energy policies.[38]

> In the Sabotage Ranking, the EIU estimates that the effectiveness of eight countries' political systems has deteriorated since 2016.[39] In addition, ratings for effective governance (an important measure of a country's ability to establish and sustain effective policies) have declined in eight countries in the Sabotage Ranking since 2016.[40] Although the ability of a government bureaucracy to establish and sustain policies to secure nuclear facilities improved in seven countries,[41] it declined in four.[42]

> Although the pervasiveness of corruption declined in Argentina, China, and Egypt, it increased in Germany and Pakistan.

> Belgium, Egypt, India, Pakistan, and Russia all face a heightened risk that a capable terrorist group could commit acts of nuclear terrorism.

Defenses against the Cyber Threat Remain Insufficient

The results of the 2018 NTI Index indicate that nuclear facilities' defenses against cybersecurity threats remain insufficient. The NTI Index asks whether domestic laws, regulations, or licensing rules require nuclear facilities to have protections in place, protect critical digital assets, include cyber threats in the Design Basis Threat,[43] conduct cybersecurity assessments, and ensure an incident-response plan is in place. Although some countries have made modest improvements, many remain poorly prepared for a cyber threat.

> One-third of countries with weapons-usable nuclear materials or nuclear facilities lack all of the basic cybersecurity regulations measured by the NTI Index. Since 2016, only 12 countries improved their cybersecurity regulations.[44]

> Only 12 countries and Taiwan with weapons-usable nuclear materials or nuclear facilities received full credit—a score of five—confirming that those countries have enacted the regulations measured in the Index.[45]

> Two-thirds of countries and Taiwan (68 percent) assessed in the NTI Index do not yet have a cyber-incident response plan, a factor measured for the first time this year. Given that cybersecurity measures never will be perfectly effective, an incident response plan and response capabilities are essential.

> Countries with large numbers of sites are more likely to have cyber-nuclear regulations in place. For example, the United States receives full credit (five points), and the Russian Federation receives four out of five points on the cybersecurity indicators. Countries with few nuclear sites (such as Algeria, Argentina, and Bangladesh) are among those that have not yet enacted cyber-nuclear regulations and consequently have scored zero out of five points on the cybersecurity indicators.

[45] Australia, Belarus, Canada, Finland, France, Germany, Hungary, the Netherlands, Romania, South Korea, the United Kingdom, and the United States.

THE CYBER THREAT TO NUCLEAR FACILITIES

The cyber threat has expanded exponentially in recent years. A series of damaging, high-profile attacks has made headlines around the world, and recent attacks against banking and commerce systems, private companies, and governments highlight the growing gap between the threat and the ability to respond to or manage it.

Like all critical infrastructure, nuclear facilities are not immune to cyberattack. That reality is particularly worrisome, however, given the potentially catastrophic consequences of a cyberattack on a nuclear facility. Such an attack could facilitate the theft of nuclear materials or an act of sabotage. For example, facilities' access control systems could be compromised, allowing the unauthorized entry of persons seeking to obtain nuclear materials or to damage the facility. Accounting systems could be manipulated so that the theft of materials goes unnoticed. Reactor cooling systems could be deliberately disabled, potentially resulting in a Fukushima-like disaster.

The pace of cyberattacks, including those involving nuclear facilities, has accelerated in recent years. For example, in 2016, three publicly known cyberattacks or attempts on information systems at nuclear facilities occurred at the University of Toyama's Hydrogen Isotope Research Center in Japan; the Gundremmingen Nuclear Power Plant in Germany; and one incident that affected both the Nuclear Regulatory Commission and the Department of Energy in the United States. In 2017, the Wolf Creek Nuclear Station in Kansas had its business systems compromised in a series of attacks targeting the energy sector.

Government authorities and facility operators are struggling to keep pace with this new threat, and national and international guidance is still evolving. As this edition of the NTI Index highlights, some countries are making progress while many others are not. Furthermore, countries with new nuclear programs face additional challenges. Not only do those countries need to establish appropriate regulatory systems, they also must attract or train cyber-nuclear experts, who are in short supply globally.

Looking forward, cyber risks to critical infrastructure (including nuclear facilities) will continue to grow, and much more work is needed to address the threat. Nuclear facilities must be protected from dangerous attacks through a combination of technology and expertise, and governments must provide assistance by sharing threat information and surge capacity provided by skilled computer emergency response teams who specialize in responding to computer security incidents.

Observations

CYBERSECURITY MEASURES IN THE NTI INDEX

Nuclear facilities are vulnerable to cyberattacks as well as physical attacks. Therefore, cybersecurity is a critical component to protecting against theft and sabotage. In the NTI Index, the following aspects of the cybersecurity challenge are measured:

› **Mandatory cybersecurity:** Do domestic laws, regulations, or licensing rules require nuclear facilities to have protection from a cyberattack?

› **Critical digital asset protection:** Do domestic laws, regulations, or licensing rules require nuclear facilities to protect critical digital assets from a cyberattack?

Critical digital assets include the following systems and networks:
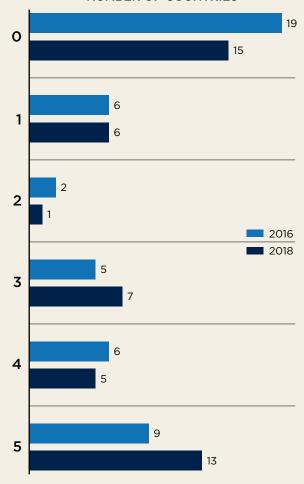

→ Safety-related functions

→ Security functions

→ Emergency preparedness functions

→ Support systems and equipment related to the above functions.

› **Cybersecurity DBT:** Does the state consider cyber threats in its threat assessment or Design Basis Threat (DBT) for nuclear facilities?

› **Cybersecurity assessments:** Does the regulator require a performance-based program, which includes tests and assessments of cybersecurity at nuclear facilities?

› **Cyber incident response plan:** Do domestic laws, regulations, or licensing requirements require a cyber-incident response plan for nuclear facilities?

CYBERSECURITY INDICATOR SCORES

Countries with Weapons-Usable Nuclear Materials or Facilities

Scored 0–5, where 5 = most favorable nuclear security conditions

NUMBER OF COUNTRIES

- 0: 2016 = 19, 2018 = 15
- 1: 2016 = 6, 2018 = 6
- 2: 2016 = 2, 2018 = 1
- 3: 2016 = 5, 2018 = 7
- 4: 2016 = 6, 2018 = 5
- 5: 2016 = 9, 2018 = 13

Among countries with weapons-usable nuclear materials in the Theft Ranking and countries with facilities in the Sabotage Ranking, performance on cyber indicators showed modest improvement, but many remain poorly prepared.
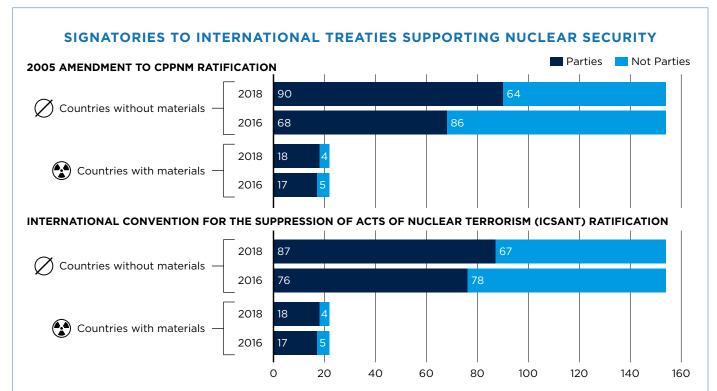

For more information about NTI's cyber-nuclear security program, see www.nti.org/cyber.

Observations

States without Nuclear Materials Actively Support Global Nuclear Security Norms

Countries without weapons-usable nuclear materials continue to actively support global nuclear security norms that address the risk that their territories could be used by terrorist or other organizations as transit points for illicit materials or as staging grounds for malicious activity. Yet many of those countries face heightened risk environments that undermine their ability to effectively counter potential terrorist activity within their borders.

› Since 2016, 31 additional countries reinforced the international legal foundation for nuclear security by ratifying either the 2005 amendment to the CPPNM or the ICSANT.

› One-third of all countries without weapons-usable nuclear materials receive full credit in the NTI Index for

United Nations Security Council Resolution (UNSCR) 1540 implementation. At the same time, there is room for improvement. Although all countries without weapons-usable nuclear materials meet the nuclear security reporting requirements of UNSCR 1540, two-thirds have yet to implement the provisions of the resolution.

› Unfortunately, the improvements to nuclear security conditions are slowed and potentially jeopardized by increasingly fragile political environments in a number of countries and regions. Among countries without weapons-usable nuclear materials, the Risk Environment scores of nearly as many countries declined as improved.[46] Risk environment factors have the potential to adversely affect countries' ability to limit terrorist activity with effective governance and political stability measures, to reduce the pervasiveness of corruption, and to restrict the capabilities of criminal groups interested in acquiring nuclear materials.

The 2005 Amendment to the CPPNM is the only international legal agreement that requires countries to protect their materials. ICSANT commits states to criminalize acts of nuclear terrorism and cooperate in bringing those who commit such crimes to justice. Those treaties are important building blocks for the foundation of global nuclear security and would be more valuable if universally implemented.

---

46 Among countries without weapons-usable nuclear materials, Risk Environment scores declined in 47 and improved in 56.

Building a Framework for Assurance, Accountability, and Action

Observations

UNSCR 1540 IMPLEMENTATION

With the goal of preventing non-state actors from developing or acquiring weapons of mass destruction, United Nations Security Council Resolution (UNSCR) 1540, enacted in 2004, requires countries to maintain "appropriate effective measures" to account for, secure, and provide physical protection for nuclear weapons and materials—even if a country has not declared nuclear materials within its borders. National efforts to implement the resolution are tracked through reporting to the United Nations' 1540 committee. The results were first published in 2009 and again in 2016.

Since the 2016 NTI Index, national reporting indicates that a number of countries have improved the extent of their UNSCR 1540 implementation, resulting in score increases in the NTI Index.[1] Ten countries with weapons-usable materials improved their scores.[2] Among countries ranked in the 2018 NTI Index's Sabotage Ranking, 29 improved their scores.[3] Overall, 79 countries improved their enforcement agencies and authorities in an effort to control border crossings and the export and import of nuclear weapons-related materials. A full 76 countries improved their controls of importation of nuclear weapons-related materials. This uptick in UNSCR 1540 reporting highlights national-level commitments to nuclear security.

---

[1] The United Nations 1540 Committee approves matrices submitted by national governments to affirm enactment of legal regimes and enforcement of the 1540 Resolution. The Committee approved a host of matrices shortly after research was completed for the NTI Index that was published in 2016, thus contributing to the high number of score increases between the 2016 and 2018 NTI Indices. More information on the methodology of this analysis can be found in the EIU Methodology, posted at www.ntiindex.org.

[2] Belarus, Canada, China, Israel, Japan, Kazakhstan, the Netherlands, Norway, Pakistan, and Russia. Among the 22 countries with nuclear weapons-usable materials, only four do not score "very good" according to the EIU's categorization of the extent of the country's UNSCR 1540 implementation: Iran, Israel, Kazakhstan, and North Korea.

[3] According to the 2018 NTI Index's Sabotage Ranking, the following countries received improved scores for the extent of their UNSCR 1540 implementation: Algeria, Argentina, Armenia, Bangladesh, Brazil, Bulgaria, Canada, Chile, China, Egypt, Hungary, India, Indonesia, Iran, Israel, Kazakhstan, Mexico, Morocco, the Netherlands, Norway, Peru, Poland, Russia, South Korea, Spain, Sweden, Switzerland, Ukraine, and Uzbekistan. All countries received a rating of "very good" except Bangladesh (which the EIU rates as "good") and Iran (which the EIU rates as "moderate").

SELECT COUNTRY HIGHLIGHTS

More than three-fourths of all countries and Taiwan in the Theft and Sabotage rankings have improved their scores since the third edition of the NTI Index, which was published in 2016. This is an encouraging development following the fourth and final Nuclear Security Summit. However, in several regions around the world, escalating international tensions and continued poor nuclear security conditions warrant concern and renewed attention to nuclear security.

Although progress on nuclear security for countries with weapons-usable nuclear materials had slowed between 2014 and 2016 (the average country score increase was only 1.2 points), scores improved by an average of 2.8 points between 2016 and 2018. Overall, the average score increase between 2012 and 2018 was 6.5 points; only North Korea's score declined over that six-year span.

Of countries with weapons-usable nuclear materials, those showing the most notable progress since the first NTI Index was published in 2012 are China, Japan, Germany, and Belgium.

› In the Theft Ranking, Australia and Switzerland are tied at the top of the list for their nuclear security conditions. Australia has ranked first in each of the previous rankings of countries with weapons-usable nuclear materials, dating to 2012.

➜ Australia's few sites and limited quantities of nuclear materials, combined with its extensive security and control measures and its commitments to global norms drive the country's consistently top scores. Australia's regulations now mandate updates to the Design Basis Threat, boosting the country's score since 2016.

➜ Switzerland, which has ranked second since 2012, now joins Australia at the top of the Theft Ranking because of its recent reductions in quantities of nuclear materials to less than 5 kilograms and because of its revised policy to transport nuclear materials for removal only. Switzerland also provided financial or in-kind contributions to the IAEA's Nuclear Security Fund in recent years.

Observations

› In the Sabotage Ranking, Finland ranks first for the second time. In addition to fulfilling all global norms, domestic commitments, and capacity measures, Finland improved its scores on insider threat prevention and response capabilities since 2016, scoring 98 out of a possible 100 points in the security and control measures category.

› Of countries with weapons-usable nuclear materials, Japan has improved its Theft Ranking score more than any other since 2012—by 22 points. Since 2016, Japan has decreased its quantities of nuclear materials and has improved its insider threat-prevention measures, physical security regulations of materials during transport, and cybersecurity regulations. Ranked 14th in the year following the 2011 Fukushima–Daiichi disaster, Japan now ranks 4th among countries with weapons-usable nuclear materials.

› China's scores increased by 14 points, while Germany and Belgium's scores improved by 11 points, between 2012 and 2018 in the Theft Ranking for countries with weapons-usable nuclear materials. By making notable improvements to insider threat prevention and physical security during transport, China now scores 75 out

of a possible 100 points for its security and control measures. China's scores on the voluntary commitments indicator improved as a result of its new Center of Excellence and its hosting of an IAEA International Physical Protection Advisory Service (IPPAS) mission in 2017, which built international confidence in the country's nuclear security conditions.

› Germany's overall score in the Theft Ranking improved as a result of enhanced insider threat prevention and cybersecurity measures. Although a corruption scandal decreased the country's previously strong Risk Environment marks, Germany ranks 4th overall in the Theft Ranking.

› Although Belgium's Risk Environment score declined since 2016 because of the threat of nuclear terrorism and a decrease in the quality of the country's bureaucracy, Belgium's security and control measures improved. In particular, Belgium has deployed armed response teams to be onsite at nuclear power facilities.[47] The total stock of nuclear materials in Belgium also is decreasing, leading to a 5-point score increase in the Quantities and Sites category since 2016.
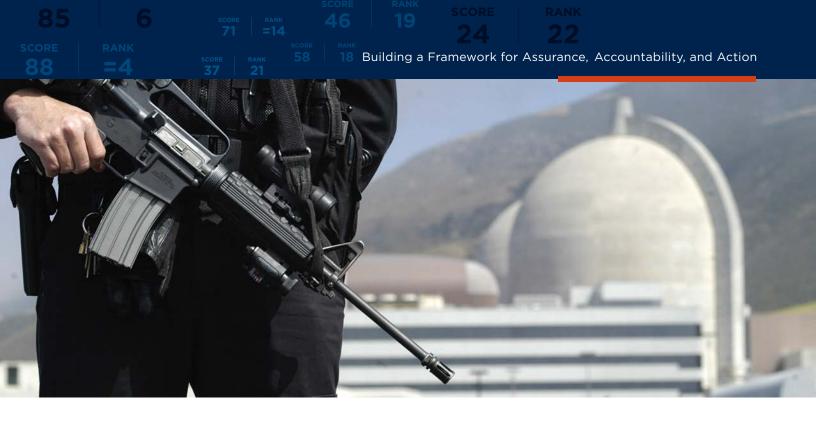

THE VALUE OF PUBLISHING NUCLEAR SECURITY REGULATIONS

A country that publishes its laws, license requirements, and regulations supports confidence in its nuclear security. Countries can make regulations and nuclear security practices public without revealing sensitive information.

The 2018 NTI Index finds that a number of countries could do more to build confidence in their security through greater transparency. Notably, scores for Iran, Israel, Pakistan, and North Korea are adversely affected by their relatively few publicly available nuclear security regulations. The absence of publicly available regulations negatively affects a country's score, even if that country has robust regulations in place. For example, North Korea's nuclear program continues to operate outside international legal and voluntary frameworks for nuclear security, and there is virtually no transparency into the country's nuclear program or security measures. The NTI Index reflects this lack by awarding North Korea a score of zero out of a potential 100 points in the category that measures adherence to global norms for nuclear materials security.

---

[47] Although the regulatory change is forthcoming, Belgium has stationed armed guards at nuclear facilities in response to recent threats.

RECOMMENDATIONS

An effective global nuclear security system to protect vulnerable nuclear materials and facilities remains elusive. In the absence of such an agreed upon, comprehensive system, the notable progress that countries have made to reduce the risks of theft and sabotage is in jeopardy. Demand for nuclear energy is growing around the world, leading more than 10 new countries to consider taking on the risks and responsibilities of ensuring nuclear security.[48] National leadership and stewardship on nuclear security is particularly critical in this time of heightened political and terrorist risks.

Following are recommendations for advancing the global nuclear security agenda by (a) building an effective global nuclear security system, (b) defending against the growing risk of cyberattack, and (c) improving state stewardship of nuclear materials and facilities.

BUILD AN EFFECTIVE GLOBAL NUCLEAR SECURITY SYSTEM

With the end of the Nuclear Security Summit process in 2016, it is more important than ever to intensify and broaden international efforts to build an effective global nuclear security system. Among the ongoing challenges is the lack of a common set of international standards and best practices, the absence of a mechanism for holding states accountable for appropriate and effective security measures, and an incomplete legal foundation for securing materials that is neither universal nor fully implemented.

The international community has taken several steps in the right direction, including the formation of the Nuclear Security Contact Group[49] at the 2016 Nuclear Security Summit, entry into force of the 2005 Amendment to the CPPNM, and the continued elimination of stocks of weapons-usable nuclear materials. Yet the current patchwork of international initiatives for securing nuclear materials and facilities still has major gaps that prevent the system from being truly comprehensive and effective.

		71	=14	88	=4		
		94	=1			84	=7

Recommendations

IAEA Director General Yukiya Amano receives countries' ratifications of the 2005 Amendment to the Convention on the Physical Protection of Nuclear Material.

The United Arab Emirates (UAE) inaugurates its first dosimetry laboratory, as the country builds a nuclear power program. The UAE has worked with the IAEA to build capacity through a series of national technical cooperation projects.

Among the most significant gaps: the majority of all highly enriched uranium and nearly half of all plutonium stocks are in non-civilian programs and thus remain outside international legal instruments on nuclear security.[50] Participation in international peer review—a tool for improving performance and building confidence about the effectiveness of a country's security—or other measures to build confidence in the security of nuclear materials remains limited. Three countries with more than one kilogram of nuclear materials have not hosted an international peer review within the past five years; four have never hosted an IAEA IPPAS or Integrated Regulatory Review Service mission.[51]

To build a system that addresses such critical gaps, countries should:

› **Bolster the international legal foundation for nuclear security and take advantage of the 2021 review conference of the CPP.** By adhering to and

participating in international treaties and guidelines related to nuclear security, countries can reinforce the existing legal framework as part of a comprehensive global nuclear security system. The 2016 entry into force of the 2005 Amendment to the CPPNM was a positive step. Moving forward, countries should sign and ratify key treaties, voluntarily implement treaty requirements before ratification, and implement IAEA nuclear security guidance.

The CPP provides a mechanism for regular review conferences to be held at intervals of at least five years, but apart from the mandatory review conference that was held five years after entry into force in 1987, the review conference mechanism has never been exercised. Now, with the 2005 Amendment to the CPPNM in force, a review conference has been scheduled for 2021, providing an important opportunity for dialogue, coordination, and progress on nuclear

---

[50] The total quantities of military materials are difficult to estimate. According to the figures collected for the NTI Index, approximately 90 percent of all highly enriched uranium globally and 40 percent of plutonium is outside of civilian control.

[51] The three countries that have not hosted a review of their security arrangements in the past five years are Iran, Kazakhstan, and the Netherlands. India, Israel, North Korea, and Pakistan have never hosted a review. International peer review is a powerful tool for improving security performance and for building others' confidence in a state's commitment to continued improvement. States can further build other governments' and stakeholders' confidence in their nuclear security practices by publishing the results of the review while redacting sensitive information. Regular participation in peer reviews will require international investment in the IAEA, which plans to expand its advisory capabilities.

SCORE	RANK		SCORE	RANK	SCORE	RANK	SCORE	RANK

SCORE	RANK		SCORE	RANK	SCORE	RANK		
88	=4		37	21	58	18		

Building a Framework for Assurance, Accountability, and Action

Recommendations

security.[52] The CPP review conference provision provides the flexibility necessary to address a broad range of nuclear security topics, and it brings a broader group of countries to the conversation than just those that participated in the Nuclear Security Summits. As depositary for the CPP, the IAEA will play an important role by serving as the designated convener of review conferences and should move quickly to name a review conference president and design a robust preparatory process.

The review conference mechanism will be used to good effect only if leaders opt to take full advantage of the opportunity. States should agree to hold regular review conferences every five years as a standing arrangement and should build robust, substantive review conference agendas and intersessional processes.

› **Strengthen and build confidence in the security of *all* materials.** The CPP, which is the primary nuclear security treaty, directly applies only to civilian nuclear materials. Countries with military nuclear materials should commit to securing them while meeting the same or higher standards as those used for peaceful activities. Those countries also should take steps to reassure others that they are securing the materials consistent at least with relevant IAEA guidelines.

› **Build international confidence in the effectiveness of nuclear security, and strengthen the IAEA's role and capacity.** Words alone are not enough to give states confidence in each other's security practices. Countries should demonstrate their commitment to enhancing and building confidence in nuclear security by conducting international peer reviews, and nuclear suppliers should make export agreements conditional on the completion of the peer reviews and the resolution of any shortcomings identified therein.[53]

Countries should declare overall quantities of materials to allow governmental and non-governmental assessments and tracking of inventories. Such declarations reassure others that materials are

properly accounted for without compromising national security interests. Public release of official documents increases confidence that the basic legal and regulatory framework for nuclear security is in place. Such information can be published while protecting sensitive information and without revealing details about site-specific security measures. For example, some countries voluntarily include declarations of highly enriched uranium quantities alongside figures of civilian plutonium in their annual reports.[54]

The IAEA plays a key role and must be strengthened to enhance its resources for nuclear security risk management. A number of resources are available to countries, such as the Nuclear Security Series recommendations and guidance; IAEA review missions, training programs, and workshops; and the Nuclear Security Conferences (held every three years). Countries should support the IAEA by providing human and financial resources, as well as providing necessary political support for the IAEA to intensify its work with member states to strengthen nuclear security.

Countries also should make voluntary commitments, such as contributing to the IAEA's Nuclear Security Fund and the World Institute for Nuclear Security or participating in the Global Initiative to Combat Nuclear Terrorism or the Global Partnership against the Spread of Weapons and Materials of Mass Destruction. Participating in training and workshops to share best practices, hosting a Center of Excellence or Nuclear Security Training and Support Center for nuclear security training, or providing and accepting bilateral or multilateral assistance further demonstrate a commitment to improving security and participating in a strengthened global system. By taking voluntary measures and publishing information about those activities, countries can build confidence in the effectiveness of their security.

---

52 For further details on the CPP review conference's mechanism for providing a path forward since the end of the summit process, see Jonathan Herbach and Samantha Pitts-Kiefer, October 2015, "More Work to Do: A Pathway for Future Progress on Strengthening Nuclear Security," *Arms Control Today*, p. 8.

53 Some states already have shared the full or partial results of peer reviews with suppliers as a confidence-building effort.

54 Pursuant to the Guidelines for the Management of Plutonium, IAEA INFCIRC 549.

DEFEND AGAINST THE GROWING RISK OF CYBERATTACK

Like all critical infrastructure, nuclear facilities are not immune to cyberattacks; such attacks could facilitate the theft of nuclear materials or an act of sabotage, potentially resulting in catastrophic public health and economic consequences. Government and facilities' responses to the risk of cyberattacks too often are inadequate. Effective cybersecurity measures—from incorporating cyber threats into threat assessments to mandating that nuclear facility licensees have cyber-incident response plans—must be incorporated into government regulations and facility operations.

The challenge, however, is not just for governments and regulators. Leaders, technical specialists, and operators at nuclear facilities must develop and implement plans that keep pace with the threat and reduce vulnerabilities at nuclear facilities. Governments should require—and facility operators should implement—information and operational technology systems that are resilient in the face of the cyber threat. Cooperation—in the form of internal continuous improvement efforts, mutual assistance mechanisms, and increased collaboration between physical and cybersecurity professionals within and outside of a nuclear facility—can boost defenses against this evolving threat. Given the potential consequences, all countries must work aggressively to ensure that their nuclear facilities are well protected from cyberattacks.

To defend nuclear facilities from cyber-mediated attacks, countries and facility operators should:

› **Promote and invest in continuous improvement of cybersecurity measures at all nuclear facilities.** Although nuclear operators struggle to prioritize cybersecurity efforts, today's cyber threat continues to evolve, outpacing defenses and regulations in many countries. Like any new threat, restructuring or energizing teams to build systems and processes that are resilient to cyberattack requires consistent improvement and leadership. Dedicated efforts are needed to embed cybersecurity best practices into the culture of nuclear facilities.

All countries should mandate that nuclear facilities be protected from cyberattack; sensitive digital assets must be protected in such a way that an attacker cannot compromise physical protection, control, accounting, or safety systems. The facility threat assessment should take into account the potential for cyberattacks, as well as for combined cyber-physical attacks. Ongoing tests and assessments should characterize the effectiveness, as well as the weaknesses, of cybersecurity measures. Each nuclear facility should have a cyber-incident response plan to limit damage and reduce recovery times in the event that a facility is successfully attacked.

Regulators and nuclear facility leaders must invest in ongoing efforts to improve both regulatory frameworks and facilities' cybersecurity protections. Physical and cybersecurity programs should be integrated and dynamic, incorporating threat intelligence from government entities and working to isolate and defend critical digital and operational assets.

› **Build mutual assistance mechanisms and shared resources for responding to cyberattacks.** A cyberattack could affect a facility anywhere in the world, with lasting global consequences for the nuclear industry. Working collaboratively to ensure a rapid and effective response to a serious cyberattack on a global level allows countries—whether those with mature nuclear programs or emerging ones—to minimize the potential consequences.

Mutual assistance efforts should take both formal and informal forms. Countries with technical capacity and experience could continue to extend support through existing bilateral or multilateral mechanisms. Sharing of threat information and vulnerabilities can provide additional benefits.

› **Increase the quality and quantity of cyber-nuclear experts.** The global competition for cybersecurity talent is fierce, and developing, maintaining, and retaining the necessary capacity in every country with nuclear facilities will be difficult. States and facility leaders should consider developing alternative means of filling talent gaps, such as mutual support agreements and investments in the skill development of current workers.

Too often, conversations about nuclear facilities' cybersecurity and physical security take place in silos. Bringing together experts in both areas to discuss concerns, trends, and strategies would bridge gaps and generate new ideas to enhance security.

IMPORTANCE OF PEER REVIEWS

One of the most valuable steps toward improving a country's nuclear security is a peer review by another country or by an international organization such as the IAEA. Such peer reviews often identify weaknesses in security and highlight practices that can be used to strengthen security at nuclear facilities and build international confidence in a country's security practices. The International Atomic Energy Agency's (IAEA's) International Physical Protection Advisory Service (IPPAS) provides peer advice about implementing international agreements and IAEA guidance for nuclear security. Those reviews currently are conducted on a voluntary, "as requested" basis.[1] To build confidence in global nuclear security, all countries with relevant nuclear facilities should invite such reviews on a recurring basis (ideally, every five years or sooner).

Only four countries in the NTI Index rankings hosted security reviews between 2016 and 2018.[2] Among countries with nuclear facilities or with weapons-usable nuclear materials, 27 countries hosted such a review within the past five years, which is four more countries than the NTI Index observed in 2016. Six countries[3] have never hosted such a review, and 14 have not been reviewed within the past five years.[4] Among countries in the Sabotage Ranking, three hosted reviews between 2016 and 2018.[5] However, four countries' reviews occurred more than five years ago (the timeframe measured in the NTI Index),[6] and their scores declined as a result: Argentina, Kazakhstan, and the Netherlands were last reviewed in 2012, and Spain was last reviewed in 2011. Conversely, four countries' scores improved as a result of new reviews: China and Germany hosted an IPPAS mission in 2017, Uzbekistan hosted a U.S. Department of Energy review in 2016, and Italy hosted an Integrated Regulatory Review Service evaluation in 2016.

---

[1] States must request or offer to host an IPPAS or other IAEA peer review mission.

[2] China, Germany, Italy, and Uzbekistan.

[3] Algeria, India, Israel, Morocco, North Korea, and Pakistan.

[4] Argentina, Bangladesh, the Czech Republic, Egypt, Iran, Kazakhstan, Mexico, the Netherlands, Peru, Slovakia, Slovenia, Spain, Taiwan, and Ukraine.

[5] China, Germany, and Uzbekistan.

[6] Argentina, Kazakhstan, the Netherlands, and Spain.

The IAEA continues its important work of developing cybersecurity resources for its member states, providing training, and conducting reviews of national and facility plans. States should contribute financial and human resources to the IAEA, including to the Nuclear Security Fund. They should contribute to scientific and technical cooperation to provide sustained support to defend against cyberattacks. Likewise, states should take advantage of IAEA, World Institute for Nuclear Security (WINS), and other opportunities to strengthen capacity, boost awareness, and improve responses to cyberattacks.

Finally, countries should engage one another in additional discussions of norms, rules of the road, and cooperative opportunities to reduce the cyber threat to nuclear facilities, building on the United Nations Group of Government Experts' discussions that developed an international consensus that states should not intentionally damage others' critical infrastructure, such as nuclear facilities.

SECURITY IN EMERGING NUCLEAR ENERGY COUNTRIES

The future for civilian nuclear power is promising but comes with potential security risks. Data collected for the NTI Index provide insight into security measures in countries seeking or expanding nuclear energy programs and show that, despite needed attention to and improvements in security, important gaps remain.

In the Middle East and North Africa, where countries are preparing to enter a new era of nuclear energy expansion:

› The United Arab Emirates, which is expected to commission its first nuclear power plant in 2019, has crafted a series of domestic regulations and made contributions to the International Atomic Energy Agency's (IAEA) Nuclear Security Fund and the World Institute of Nuclear Security (WINS) since 2016.

› Two countries considering nuclear power, Saudi Arabia and Jordan, have increased their voluntary contributions to international nuclear security efforts since 2012. Jordan also became a member of the Global Partnership against the Spread of Weapons and Materials of Mass Destruction.

› Although Egypt currently has a nuclear research reactor and is planning four new nuclear power reactors,[1] it ranks 43rd out of 44 countries and Taiwan in the Sabotage Ranking. It lags in several areas, including on-site physical protection, insider threat prevention, response capabilities, and cybersecurity for nuclear facilities.

In Central Europe, where ambitious plans for nuclear power are underway:

› Belarus is building its first nuclear power plant, with plans to begin operation in 2019. As a steward of weapons-usable nuclear materials, it ranks 7th among 22 in the Theft Ranking. Belarus scores above average on a number of physical security and cybersecurity measures assessed, and it receives full credit for having hosted an international security review within the past five years. However, Belarus has not ratified the 2005 Amendment to the Convention on the Physical Protection of Nuclear Materials, nor has it ratified the IAEA's Model Additional Protocol, which provides for enhanced IAEA safeguards.

› Poland expects to construct its first nuclear power plant by 2025.[2] The country currently maintains a research reactor at one site and is 19th in the Sabotage Ranking, down from 15th in 2016. Poland receives credit for having hosted a review of its security arrangements within the past five years.

› Although Belarus' risk environment for nuclear security has improved slightly since 2016, Poland's has declined because of an increased risk of significant violent social unrest (both civil and labor) and a decline in the ability of the country's bureaucracy to carry out government policy.

Building a Framework for Assurance, Accountability, and Action

Recommendations

Turkey and Bangladesh are constructing new power plants, with plans to begin operation in 2023:[3]

› In the Theft Ranking of countries without weapons-usable nuclear materials, Turkey receives full credit for its implementation of United Nations Security Council Resolution 1540, its domestic nuclear materials security legislation, and its safeguards adherence and compliance. However, Turkey's Risk Environment scores have deteriorated. The EIU's rating of Turkey's risk conditions for nuclear security dropped 15 points between 2016 and 2018 to 24 points out of a possible 100. The risk of social unrest is rated as high, risks to orderly transfer of power have increased, and a moderate risk of armed conflict within the next two years exists. The ability of the country's bureaucracy to carry out government policy is rated as low in the EIU Risk Briefing, and the pervasiveness of corruption among public officials is rated as high. Finally, terrorist groups that have the capabilities to illicitly acquire nuclear materials are believed to be active in the country.

› In the Index's Sabotage Ranking, Bangladesh ranks 41st out of 44 countries and Taiwan with nuclear facilities at risk of sabotage. Its security and control measures, response capabilities, and control and accounting procedures need improvement. Bangladesh receives no credit for its insider threat prevention or cybersecurity regulations. Although improving, Bangladesh's risk environment for nuclear security remains low (the EIU awards a score of 35 points out of a possible 100). The EIU assesses the risk of violent demonstrations or civil unrest within the next two years and the pervasiveness of corruption among public officials as "very high."

IMPROVE STATE STEWARDSHIP OF NUCLEAR MATERIALS AND FACILITIES

The four Nuclear Security Summits held between 2010 and 2016 assembled world leaders to focus global attention on the critical importance of securing nuclear materials and facilities. Through national commitments, countries took actions to reduce the chance that nuclear materials could be stolen or facilities sabotaged. In the combined 2014 and 2016 NTI Indexes, 19 improvements were directly attributable to previous summit commitments. This year, 18 improvements were directly traceable to the summit process.[55]

The job of securing all weapons-usable nuclear materials and of building an effective global nuclear security system is far from finished, however. At the 2016 Nuclear Security Summit, leaders agreed to five "action plans" that describe how the IAEA, Interpol, the United Nations, the Global Initiative to Combat Nuclear Terrorism, and the Global Partnership against the Spread of Weapons and Materials of Mass Destruction would continue the important work begun through the summits. Much of the work committed to in those plans, however, remains unfinished. Leaders must be held responsible not only for meeting the 2016 commitments but also for moving beyond them to close the remaining gaps in the international nuclear security system. Countries should actively participate in IAEA ministerial meetings and CPP review conferences, and they should raise pragmatic and progressive nuclear security initiatives at G7 summits and the like.

Particularly as the use of nuclear power spreads globally, it is essential to maintain safety, security, safeguards, and confidence in the exclusively peaceful use of nuclear energy. Security should be embedded into developing fuel cycles internationally, while countries—including those with established nuclear programs—should maintain a

---

55 This analysis mirrors that of prior NTI Index reports. It considers whether improvements in the NTI Index are directly related to a national commitment made during a Nuclear Security Summit in the form of either a national statement or participation in a joint statement or "gift basket." The NTI's methodology for considering whether a commitment has been "fulfilled" includes national mention of the improvement in nuclear security conditions within a Nuclear Security Summit Progress Report. In the 2016 NTI Index, NTI observed only six improvements directly related to Nuclear Security Summit commitments; in the 2014 NTI Index, NTI observed 13 improvements directly related to Nuclear Security Summit commitments.

Recommendations

focus on the conditions that underpin nuclear security. As risks increase alongside the growing quantities of nuclear materials, no new facilities capable of producing weapons-usable nuclear materials should be constructed unless there is unmet commercial demand.

To provide for nuclear security, countries should:

› **Commit to further decreases in stocks and applications that require use of weapons-usable nuclear materials.** The more nuclear materials and sites, the greater the exposure to risk of theft. All countries should work to minimize their use of weapons-usable nuclear materials, and they should reduce or eliminate stockpiles of those materials where possible. To do that, countries should end their use of highly enriched uranium (HEU) for civilian purposes wherever possible.

HEU is a central component of a nuclear bomb; low-enriched uranium (LEU) is not. Although most HEU is designated for nuclear weapons purposes, significant amounts remain in civilian programs and non-weapons applications. Given that nearly all civilian and naval applications of HEU fuel have established LEU alternatives, the international community must take steps now to accelerate efforts to minimize—and ultimately eliminate—HEU in the civilian and naval spheres. This goal could include the creation of regional HEU-free zones that underpin the global norm against civilian HEU use.

Plutonium also contains significant security risks, particularly separated plutonium. To minimize its associated risks, countries must reduce plutonium stocks to minimum levels and must adhere to fuel cycle policies that keep new plutonium and fresh mixed oxide production in balance with consumption.

Finally, as countries move toward the development and deployment of advanced nuclear reactors, they must consider the security implications of their new designs. The reactors and their associated fuel cycle facilities are still in the design phase, so developers should

consider how to build in security features now that will limit opportunities for theft or diversion of attractive material in the future. That effort will make implementing IAEA nuclear security guidelines easier for operators.[56]

› **Improve core security and control measures.** Although improvements in the protection of nuclear facilities have been made, critical gaps remain. More than half of the countries in the Sabotage Ranking still have room to improve their on-site physical protection regulations or material control and accounting procedures. Only three countries with nuclear facilities at risk of sabotage have the most favorable nuclear security conditions to protect against insider threats.[57] Countries should prioritize improving the strength of the security culture at all types of nuclear sites. In particular, those countries that are developing new nuclear power reactors should upgrade regulatory frameworks commensurate with the threat and should incorporate lessons from countries with long-standing nuclear power programs. Countries also should enhance their participation in organizations like WINS to train and support their nuclear workforce, host international security reviews, and gain lessons from peer reviews and IAEA advisory services.

› **Reduce political risks that can undermine nuclear security.** In addition to improving the security and control measures of nuclear materials and facilities and to bolstering global norms for secure nuclear use, countries should not overlook the political and economic factors that exacerbate terrorist threats to nuclear materials and facilities. Governments should intensify efforts to maintain political stability and effective governance while reducing illicit activity, including corruption, criminal activity, and terrorism. Countries with political risk factors should redouble their efforts on nuclear security to ensure that their materials and facilities are well secured.

---

[56] Some of the advanced reactors use fuels based on plutonium or high-assay low-enriched uranium (such as 19 percent) that are different from current light-water reactor fuel cycles. Those reactors could lead to the need to process, transport, and dispose of nuclear materials that are more attractive for theft or diversion. In some cases, new fuel production facilities will be required. Some advanced reactors are designed to be built on ships or trucks, which could create different kinds of security risks compared to the large, visible footprints of current nuclear power plants.

RESULTS TABLES

The tables on the following pages provide high-level results for the NTI Index Theft Ranking for countries with weapons-usable nuclear materials, the Theft Ranking for countries without materials, and the Sabotage Ranking for countries with nuclear facilities the sabotage of which could lead to a dangerous release of radiation. The tables provide country rankings and scores, overall and by each category. The Theft Ranking tables also include changes from 2016 and cumulative changes from 2012, when the first NTI Index was released. The Sabotage Ranking tables include changes from 2016, the first year of its tracking in the NTI Index.

Due to an addition to the frameworks, comparisons between the 2018 edition and previous published editions are not possible. To allow for accurate year-on-year comparisons, the EIU re-scored the previous editions using the new framework. The EIU also reviewed newly available information and made updates or corrections to past data, where necessary. The scores and changes in scores included in this report reflect these updates.

Overall scores are calculated using a weighted sum of category and indicator scores. A full discussion of categories, indicators, and their weighting is included in the EIU Methodology at www.ntiindex.org.

Country rankings preceded by an equal sign (=) indicate a tie with other countries.

Overall and category scores range from 0–100, where 100 equals the most favorable nuclear security conditions. In the NTI Index, scores of 0 and 100 represent the lowest or highest possible score, respectively, as measured by the NTI Index criteria.

For information on Taiwan's status and its treatment in the NTI Index, see the full EIU Methodology at www.ntiindex.org.

About the International Panel of Experts

ABOUT THE INTERNATIONAL PANEL OF EXPERTS

To develop the NTI Index, the Economist Intelligence Unit (EIU) and NTI convened a panel of highly respected nuclear security experts with a broad range of expertise from both nuclear- and non–nuclear weapon states around the world. The panel included experts from Argentina, Australia, China, India, Japan, Kazakhstan, Pakistan, Russia, South Africa, Sweden, the United Kingdom, the United States, and Vietnam. Among those, one panel member is a representative from the World Institute for Nuclear Security, and one is a former International Atomic Energy Agency (IAEA) official.

The panel advised NTI and the EIU on the selection of indicators and their relative importance. Panel members were instrumental in considering options for strengthening the NTI Index (for example, the inclusion of the new cybersecurity subindicator) and for helping develop the framework for the Sabotage Ranking. The panel's input helps ensure that the NTI Index has an international point of view and reflects the ongoing international discussion about nuclear security priorities.

Panel members do not represent their country's interests, nor do they score individual countries. Instead, they play an advisory role in their personal, not professional, capacities. Participation in the International Panel of Experts does not imply endorsement of every aspect of the NTI Index, nor does it imply endorsement of the Index's findings and recommendations. On the contrary, panel meetings demonstrated a range of views and highlighted the need for a continuing dialogue on priorities.

PANEL MEMBERS

Dauren Aben: Senior Research Fellow, Eurasian Research Institute

Irma Arguello: Founder and Chair, NPSGlobal Foundation; Head of Secretariat of the Latin American and Caribbean Leadership Network; Member of the Steering Committee of the Fissile Materials Working Group

John Carlson: Counselor, NTI; former Director General of the Australian Safeguards and Non-Proliferation Office

Anatoly Diakov: Professor, Moscow Institute of Physics and Technology

Anna Ellis: Director, Indigon Nuclear, United Kingdom

Roger Howsley: Executive Director, World Institute for Nuclear Security

Feroz Khan: Research Professor at U.S. Naval Postgraduate School; Brigadier-General (retired), Pakistan

Masahiro Kikuchi: President of the Japan Association of Disarmament Studies

Frans Mashilo: Head of Security, Center for Scientific and Industrial Research, Pretoria, South Africa

Steve Nesbit: Director, Nuclear Policy and Support, Duke Energy

Anita Nilsson: Executive Director, AN & Associates; Advisor, Federation of American Scientists; Senior Fellow of the Center for International Trade and Security, University of Georgia; former director of IAEA Office of Nuclear Security

Scott Sagan: The Caroline S. G. Munro Professor of Political Science; Senior Fellow, Center for International Security and Cooperation, Stanford University

Sheel Kant Sharma: Distinguished Fellow, Centre for Air Power Studies, New Delhi, India

Tuan Ta Minh: Associate Professor, The Diplomatic Academy of Vietnam

Hui Zhang: Senior Research Associate, Project on Managing the Atom, Belfer Center for Science and International Affairs, Harvard University

ABOUT NTI AND THE EIU

NUCLEAR THREAT INITIATIVE
www.nti.org

The Nuclear Threat Initiative works to protect our lives, environment, and quality of life now and for future generations. We work to prevent catastrophic attacks with weapons of mass destruction and disruption (WMDD)—nuclear, biological, radiological, chemical, and cyber. Founded in 2001 by former U.S. Senator Sam Nunn and philanthropist Ted Turner who continue to serve as co-chairs, NTI is guided by a prestigious, international board of directors. Ernest J. Moniz serves as chief executive officer and co-chair; Des Browne is vice chair; and Joan Rohlfing serves as president.

ECONOMIST INTELLIGENCE UNIT
www.eiu.com

The Economist Intelligence Unit (EIU) is the research arm of The Economist Group, publisher of *The Economist*. As the world's leading provider of country intelligence, we help governments, institutions and businesses by providing timely, reliable and impartial analysis of economic and development strategies. Through our public policy practice, we provide evidence-based research for policymakers and stakeholders seeking measurable outcomes, in fields ranging from finance and gender to energy and technology. We conduct research through interviews, regulatory analysis, quantitative modelling and forecasting, and display the results via interactive data visualisation tools. Through a global network of more than 650 analysts and contributors, we continuously assess and forecast political, economic and business conditions in more than 200 countries and territories.

Building a Framework for Assurance, Accountability, and Action

Methodology FAQ

METHODOLOGY FAQ

This appendix summarizes the 2018 NTI Index methodology for the two Theft Rankings (one includes countries with weapons-usable nuclear materials, and the other includes countries without weapons-usable nuclear materials) and the Sabotage Ranking. More detailed information is available in the full methodology appendix prepared by the Economist Intelligence Unit (EIU) and available at www.ntiindex.org.

NTI prioritizes openness throughout the Index process. The 22 governments that have weapons-usable nuclear materials and the 25 governments that do not but that are included in the Sabotage Ranking were offered the opportunity to review and comment on preliminary results to ensure that the NTI Index reflects the most accurate and up-to-date information possible. Of the 46 countries and Taiwan, 26 took advantage of this opportunity.[58]

HOW IS THE INDEX DEVELOPED?

The NTI Index is constructed to assess the state of nuclear security in countries around the world. The NTI Index development process is specifically designed to be rigorous and transparent and to embrace an international perspective. To develop the Index, NTI works closely with an International Panel of Experts to identify a set of indicators and subindicators that characterize a country's nuclear security conditions. A slightly modified set of indicators and subindicators is used to assess countries in the Sabotage Ranking. The categories and indicators are weighted in a way that reflects their relative importance, as determined by NTI in conjunction with the International Panel of Experts.

The EIU leads the research process, taking advantage of its global network of analysts skilled in researching country laws and regulations. EIU analysts rely on public and open-source information, including national laws and regulations, government reports and public statements, and reports from non-governmental organizations and international organizations such as the IAEA. The NTI Index does not provide a facility-by-facility assessment of security practices.

THEFT RANKING

What is the Theft Ranking?

The "Theft Ranking" refers to two rankings that assess nuclear materials security conditions with respect to the risk of theft of weapons-usable nuclear materials for (a) 22 countries with one kilogram or more of weapons-usable nuclear materials and (b) 154 countries with less than one kilogram of or no weapons-usable nuclear materials all.[59] Countries without weapons-usable nuclear materials are included because they have a responsibility to ensure that they do not serve as safe havens, staging grounds, or transit routes for illicit nuclear activities. The 2012 and 2014 editions of the NTI Index included only these two Theft Rankings. The Sabotage Ranking was added for the first time in the 2016 NTI Index, alongside the third edition of the Theft Ranking. The 2018 NTI Index continues to include both.

What are weapons-usable nuclear materials?

For purposes of the Theft Ranking, the term "weapons-usable nuclear materials" includes highly enriched uranium (HEU), which is uranium enriched to 20 percent or more in the isotope U-235 (including spent fuel); separated

---

58 Argentina, Australia, Belarus, Belgium, Canada, Chile, the Czech Republic, Finland, France, Germany, Hungary, Italy, Japan, Mexico, the Netherlands, Norway, Peru, Romania, Slovenia, South Korea, Sweden, Switzerland, Taiwan, the United Kingdom, Ukraine, and the United States.

59 The threshold of one kilogram takes into account the International Atomic Energy Agency's INFCIRC/225, Rev. 5, which states that quantities greater than one kilogram of HEU should be afforded higher levels of protection. NTI recognizes that some states may have gram quantities of weapons-usable nuclear materials in multiple locations that, added together, may bring totals to more than one kilogram. For purposes of the Theft Ranking and the need to rely on publicly available information, those states are grouped with states that have no weapons-usable nuclear materials.

HOW THE THEFT RANKING MEASURES NUCLEAR SECURITY CONDITIONS

1. ☢ **Quantities and Sites**

1.1 Quantities of nuclear materials

1.2 Sites and transportation

1.3 Material production / elimination trends

2. 🛡 **Security and Control Measures**

2.1 On-site physical protection

2.2 Control and accounting procedures

2.3 Insider threat prevention

2.4 Physical security during transport

2.5 Response capabilities

2.6 Cybersecurity

5. ⚠ **Risk Environment**

5.1 Political stability

5.2 Effective governance

5.3 Pervasiveness of corruption

5.4 Group(s) interested in illicitly acquiring materials

THEFT

3. 🌐 **Global Norms**

3.1 International legal commitments

3.2 Voluntary commitments

3.3 International assurances*

4. ⚖ **Domestic Commitments and Capacity**

4.1 UNSCR 1540 implementation

4.2 Domestic nuclear materials security legislation

4.3 Safeguards adherance and compliance

4.4 Independent regulatory agency*

The Theft Ranking assesses countries with weapons-usable nuclear materials based on these five categories. Countries without materials were assessed on three categories.

KEY

☢ Countries with weapons-usable nuclear materials

⊘ Countries without weapons-usable nuclear materials

*This indicator does not apply to countries without nuclear materials.

Note: For information about data sources used for scoring, see the full EIU Methodology at www.ntiindex.org.

Building a Framework for Assurance, Accountability, and Action

Methodology FAQ

plutonium, which is plutonium separated from irradiated nuclear fuel by reprocessing; and the plutonium content in fresh mixed oxide fuel, which consists of blended uranium and plutonium that can be used to fuel nuclear power plants.

What does the Theft Ranking assess?

The Theft Ranking assesses nuclear materials security conditions with respect to the theft of weapons-usable nuclear materials that could be used to build a nuclear device. The Theft Ranking does not assess security for low-enriched uranium or for the radiological materials needed to build a "dirty bomb," nor does it assess proliferation risks or disarmament. All of those areas are critical and must also be addressed by governments. The Theft Ranking for countries with weapons-usable nuclear materials assesses countries against a broad framework of five categories with 20 indicators and 61 subindicators. The Theft Ranking for countries without weapons-usable nuclear materials assesses countries against only three categories with 9 indicators and 27 subindicators. Indicators reflect policies, actions, and other conditions that shape a state's overall nuclear materials security.

What changes have been made to the Theft Ranking since the 2016 edition?

Since the 2016 NTI Index, minimal changes have been made to the Theft Ranking. Specifically, a subindicator was added to the Cybersecurity indicator to assess whether countries require nuclear facilities to develop a cyber-incident response plan.

In addition, because Argentina and Poland removed all of their weapons-usable nuclear materials since the previous edition of the NTI Index, both countries moved from the ranking of countries with materials to the ranking of countries without materials. The ranking for countries with materials now has 22 countries, and the ranking for countries without materials now has 154 countries. For more information on those changes, see the full EIU Methodology at www.ntiindex.org.

If the Theft Ranking has changed, how are scores compared across years?

To allow for accurate year-over-year comparisons so that progress may be tracked even when the Index framework has been updated, the EIU rescores countries in prior editions of the NTI Index using the updated framework and the data that would have been available when research for each respective edition was conducted. Additional review and research of scores from prior editions also is conducted on an as-needed basis.

SABOTAGE RANKING

What is the Sabotage Ranking?

The "Sabotage Ranking" assesses the nuclear security conditions of 44 countries and Taiwan with nuclear facilities, the sabotage of which could result in a dangerous release of radiation that could cause serious health consequences. All 44 countries and Taiwan also are included in one of the two versions of the Theft Ranking—20 have one kilogram or more of weapons-usable nuclear materials, and 24 countries and Taiwan have less than one kilogram of or no weapons-usable nuclear materials.

What does the Sabotage Ranking measure?

The Sabotage Ranking measures nuclear security conditions with respect to the sabotage of nuclear facilities. For purposes of the NTI Index related to sabotage, nuclear facilities are defined as those facilities, the sabotage of which could result in a dangerous release of radiation. They include (a) operating nuclear power reactors or nuclear power reactors that have been shut down within the past five years, (b) research reactors with a capacity of two megawatts or greater, (c) reprocessing facilities, and (d) spent fuel pools only if the fuel has been discharged in the past five years and if not associated with an operating reactor.

The Sabotage Ranking assesses countries against five categories with 16 indicators and 52 subindicators. Indicators reflect policies, actions, and other conditions that shape a country's overall nuclear security.

NTI Nuclear Security Index
THEFT | SABOTAGE

Methodology FAQ

HOW THE SABOTAGE RANKING MEASURES NUCLEAR SECURITY CONDITIONS

SABOTAGE

1. Number of Sites
1.1   Number of sites

2. Security and Control Measures
2.1   On-site physical protection
2.2   Control and accounting procedures
2.3   Insider threat prevention
2.4   Response capabilities
2.5   Cybersecurity

3. Global Norms
3.1   International legal commitments
3.2   Voluntary commitments
3.3   International assurances

4. Domestic Commitments and Capacity
4.1   UNSCR 1540 implementation
4.2   Domestic nuclear security legislation
4.3   Independent regulatory agency

5. Risk Environment
5.1   Political stability
5.2   Effective governance
5.3   Pervasiveness of corruption
5.4   Group(s) interested in committing acts of nuclear terrorism

The Sabotage Ranking assesses countries with nuclear facilities based on these five categories.

Note: For information about data sources used for scoring, see the full EIU Methodology at www.ntiindex.org.

A more detailed description of scoring criteria and sources is available in the full EIU Methodology at www.ntiindex.org.

What are the differences between the Theft Ranking and the Sabotage Ranking?

Because security measures to protect nuclear facilities and to protect materials against theft and sabotage often are related, NTI and the EIU—with input from the International Panel of Experts and technical advisors—looked at the framework for the Theft Ranking to determine which indicators and subindicators would be relevant to sabotage in their current format, which indicators and subindicators would need to be edited or deleted, and whether the Sabotage Ranking should include any new indicators and subindicators that are relevant to sabotage but not theft.

As a result of that analysis, 14 subindicators from the Theft Ranking were not included, and 5 subindicators were added.

SCORE **88** RANK **=4** SCORE **37** RANK **21** SCORE **58** RANK **18** Building a Framework for Assurance, Accountability, and Action

Methodology FAQ

What changes have been made to the Sabotage Ranking since 2016?

Because both the Theft and Sabotage Rankings evaluate cybersecurity, the Sabotage Ranking also is affected by the minor update made to indicator 2.5 Cybersecurity. Specifically, a subindicator was added to measure whether countries require nuclear facilities to develop a cyber-incident response plan.

If the Sabotage Ranking has changed, how are comparisons made across years?

To allow for accurate year-over-year comparisons so that progress may be tracked even when the Index framework has been updated, the EIU rescores countries in prior editions of the NTI Index using the updated framework and the data that would have been available when research for each respective edition was conducted. Additional review and research of scores from prior editions is also conducted on an as-needed basis.

GENERAL METHODOLOGY

How are scores calculated, and what do they mean?

The overall score (0–100) for each country in the NTI Index is a weighted sum of the categories. Each category is scored on a scale of 0–100, where 100 represents the most favorable nuclear security conditions, and 0 represents the least favorable security conditions in the NTI Index. The subindicator scores (ranging from 0 to 8, depending on the question) are summed to determine the indicator score. Each category is normalized on a scale of 0–100 on the basis of the sums of underlying indicator scores, and a weight is then applied. How each category is weighted is based on input from the International Panel of Experts and reflects the relative importance and relevance of each category and indicator. A score of 100 in the NTI Index does not indicate that a country has perfect nuclear security conditions, and a score of 0 does not mean that a country has no security; instead, the scores of 100 and 0 represent the highest and lowest possible scores, respectively, as measured by the NTI Index criteria.

How was the data gathered?

The EIU employed country experts and regional specialists from its global network of more than 350 analysts and contributors around the world. Most of the research was conducted between October 2017 and April 2018, although data were updated as late as June 15, 2018, as new information became available. Therefore, actions taken by countries after June 15, 2018, are not captured in this edition of the NTI Index.[60]

What types of information were used to score countries?

In creating the NTI Index, the EIU relied on publicly available sources, including (a) primary legal texts and legal reports; (b) government publications and reports; (c) academic publications and reports; (d) websites of government authorities, international organizations, and non-governmental organizations; (e) interviews with experts; and (f) local and international news media reports. In addition, the EIU proprietary country rankings and reports (specifically "Risk Briefing" and the "Business Environment Ranking") were used to score indicators in the Risk Environment category. Governments provided additional information in response to data review and confirmation requests.

The NTI Index does not provide a facility-by-facility assessment of security practices, and neither the EIU nor NTI conducts research at facilities. Although facility-level assessments would provide important "ground truth" information, such information currently is not available because of the sensitive nature of specific security arrangements.

In the cases of Iran, Israel, North Korea, and Pakistan, publicly available information is lacking. However, because those countries rely on military (or, in the case of Israel, civil defense force) protection for nuclear sites, scores were assigned using a proxy indicator: military capability or sophistication. In some cases, scores relied on expert input or other secondary expert sources. For a detailed description of how challenging countries were scored, see the full EIU Methodology at www.ntiindex.org.

---

60 One exception is the input from a single country, which submitted information for data confirmation in July 2018.

Methodology FAQ

Does the NTI Index account for recent initiatives such as those involving Iran and North Korea?

The NTI Index's scope is limited to assessing the nuclear security conditions within a country to prevent the theft of weapons-usable nuclear materials, as well as the sabotage of nuclear facilities. It does not consider measures to prevent the proliferation of nuclear materials or technologies. As a result, nuclear non-proliferation initiatives such as the Joint Comprehensive Plan of Action or the recent bilateral engagement between the United States and North Korea do not directly affect countries' scores in the NTI Index.

Were governments consulted during the development of the NTI Index?

All countries in the Theft and Sabotage Rankings were offered briefings on the NTI Index at the beginning of the process. In addition, after researching and gathering data, NTI and the EIU provided the 46 countries and Taiwan with an opportunity to review and comment on the EIU's preliminary results. The purpose of this data review and confirmation process was to ensure the accuracy of the 2018 NTI Index data, given that much of the research involves subjects for which information is not always publicly available. Thirteen countries with one kilogram or more of nuclear materials in the Theft Ranking and 23 countries and Taiwan in the Sabotage Ranking participated in the data confirmation process.[61]

What other experts were consulted during the development of the NTI Index?

NTI and the EIU received input from the International Panel of Experts. A list of panel members and a description of their role is included in the About the International Panel of Experts section on page 43. In addition to the international panel, technical advisors were consulted.

Where can I find all of the scores and data?

All information is available on the NTI Index website, www.ntiindex.org. The scores for indicators and subindicators in both versions of the Theft Ranking and in the Sabotage Ranking are included in three models that are available as Excel workbooks. The models offer a wide range of analytic tools, thereby allowing a deeper investigation of measures of nuclear security globally. Users can filter countries by region, for example, or by membership of international organizations or multilateral initiatives. Users can compare any two countries directly and can examine correlations between indicators. Individual country profiles are also included in the models, thus permitting a deeper dive into the nuclear security conditions in a given country.

The weights assigned to each indicator can be changed to reflect different assumptions about the importance of categories and indicators. A user can also change individual subindicator scores to see how a country's overall scores would have been different if, for example, it had ratified a treaty or taken some other action captured in the NTI Index. Finally, the model allows the final scores to be benchmarked against external factors that may potentially influence nuclear security.

---

[61] Countries with weapons-usable nuclear materials that participated in the data confirmation process include: Australia, Belarus, Belgium, Canada, France, Germany, Italy, Japan, the Netherlands, Norway, Switzerland, the United Kingdom, and the United States. Countries with nuclear facilities at risk of dangerous radiation releases that participated in the data confirmation process include: Argentina, Australia, Belgium, Canada, Chile, the Czech Republic, Finland, France, Germany, Hungary, Japan, Mexico, the Netherlands, Norway, Peru, Romania, Slovenia, South Korea, Sweden, Switzerland, Ukraine, the United Kingdom, and the United States.

FRAMEWORK FOR THE THEFT RANKING

The following chart provides the framework—categories, indicators, subindicators, and weights—for the Theft Ranking. Weights (as percentages) are shown for the Theft Ranking for countries with weapons-usable nuclear materials. Weights for the countries without materials, as well as a more detailed description of scoring criteria and sources, are available in the EIU Methodology at www.ntiindex.org.

1	QUANTITIES AND SITES	16%
1.1	**Quantities of Nuclear Materials** *The larger the quantity of nuclear material held, the greater the materials management requirements and potential risk that materials could be stolen.*	42%
1.1.1	Quantities of nuclear materials	
1.2	**Sites and Transportation** *The greater the number of sites with nuclear materials and the frequency of transport of those materials, the greater the potential risk of security breaches.*	35%
1.2.1	Number of sites	
1.2.2	Bulk processing facility	
1.2.3	Frequency of materials transport	
1.3	**Material Production and Elimination Trends** *Increasing or decreasing the quantities of nuclear materials in a state changes the potential risk of materials being stolen.*	23%
1.3.1	Material production/elimination trends	
2	SECURITY AND CONTROL MEASURES	29%
2.1	**On-Site Physical Protection** *Essential measures for securing sites and facilities.*	20%
2.1.1	Mandatory physical protection	
2.1.2	On-site reviews of security	
2.1.3	Design Basis Threat (DBT)	
2.1.4	Security responsibilities and accountabilities	
2.1.5	Performance-based program	
2.2	**Control and Accounting Procedures** *Materials control and accounting, which are necessary elements of a comprehensive security system.*	15%
2.2.1	Legal and regulatory basis for material control and accounting (MC&A)

Selected Country Summaries

SELECTED COUNTRY SUMMARIES

This section includes country summaries for the 22 countries with weapons-usable nuclear materials that are assessed in the Theft Ranking and the 44 countries and Taiwan assessed in the Sabotage Ranking. Twenty countries appear in both the Theft Ranking for countries with nuclear materials and the Sabotage Ranking and therefore have two separate country summaries. All summaries, including those for the 154 countries with less than one kilogram of weapons-usable nuclear materials or none at all, can be accessed easily online at www.ntiindex.org.

Each summary provides a snapshot of that state's scores and rankings overall and in each of the major index categories, as well as changes in scores since the 2016 NTI Index. Rankings preceded by an equals sign (=) indicate a tie with another country. In the NTI Index, scores of 0 and 100 represent the lowest and highest possible scores, respectively, as measured by the NTI Index criteria.

For each country and Taiwan, indicators are placed into one of three categories: green, indicating an above-average score; yellow, indicating an average score; or red, indicating a below-average score. The countries and Taiwan seeking to improve their nuclear security conditions can focus their efforts on those indicators in the yellow and red categories.

THEFT RANKING

The 22 countries with one kilogram or more of weapons-usable nuclear materials in the Theft Ranking are:

Australia	Japan
Belarus	Kazakhstan
Belgium	Netherlands
Canada	North Korea
China	Norway
France	Pakistan
Germany	Russia
India	South Africa
Iran	Switzerland
Israel	United Kingdom
Italy	United States

SABOTAGE RANKING

The 44 countries and Taiwan in the Sabotage Ranking are:

Algeria	Mexico
Argentina	Morocco
Armenia	Netherlands
Australia	North Korea
Bangladesh	Norway
Belgium	Pakistan
Brazil	Peru
Bulgaria	Poland
Canada	Romania
Chile	Russia
China	Slovakia
Czech Republic	Slovenia
Egypt	South Africa
Finland	South Korea
France	Spain
Germany	Sweden
Hungary	Switzerland
India	Taiwan*
Indonesia	Ukraine
Iran	United Kingdom
Israel	United States
Japan	Uzbekistan
Kazakhstan	
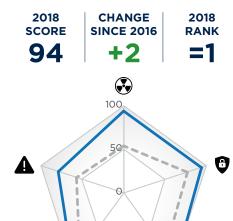

* For information on Taiwan's status and its treatment in the NTI Index, see the full EIU Methodology at www.ntiindex.org.

2018 RANK
=1

HIGHLIGHTS

Australia is tied for first in the Theft Ranking for countries with weapons-usable nuclear materials. Since 2016, Australia has improved its nuclear security conditions by adopting regulations that require updating its Design Basis Threat and a cyber-incident response plan at nuclear facilities. Australia could further improve its nuclear security conditions by strengthening insider threat prevention measures.

BELARUS

	2018 SCORE	CHANGE SINCE 2016	2018 RANK
	84	**+1**	**=7**

HIGHLIGHTS

Belarus is tied for seventh in the Theft Ranking for countries with weapons-usable nuclear materials. Belarus could improve its nuclear security conditions by ratifying the 2005 Amendment to the CPPNM and the IAEA Additional Protocol. Belarus' nuclear security conditions remain adversely affected by its large quantities of weapons-usable nuclear materials, as well as by governance and corruption challenges.

THEFT RANKING: COUNTRY SUMMARIES

BELGIUM

2018 SCORE	**81**
CHANGE SINCE 2016	**-2**
2018 RANK	**=9**

HIGHLIGHTS

Belgium is tied for ninth in the Theft Ranking for countries with weapons-usable nuclear materials. Since 2016, Belgium has improved its nuclear security conditions by posting armed guards at nuclear facilities and by decreasing its stocks of nuclear materials. Belgium could improve its nuclear security conditions by requiring more stringent and frequent personnel vetting and by enhancing its cybersecurity requirements at nuclear facilities. Belgium's nuclear security conditions are adversely affected by governance challenges and by the judgment that groups interested in and capable of illicitly acquiring nuclear materials are present in the country.

THEFT RANKING: COUNTRY SUMMARIES

CHINA

2018 SCORE	CHANGE SINCE 2016	2018 RANK
71	**+11**	**=14**

HIGHLIGHTS

China has increased its score by 11 points since 2016 and is now tied for 14th in the Theft Ranking for countries with weapons-usable nuclear materials. Since 2016, China improved its nuclear security conditions by increasing insider threat prevention measures, establishing a Center of Excellence, improving security during transport, and hosting a new international security review. China could further improve by establishing cybersecurity regulations, requiring more frequent personnel vetting, and mandating the reporting of suspicious behavior at nuclear facilities. China's nuclear security conditions remain adversely affected by large quantities and sites of weapons-usable nuclear materials.

🔴 JAPAN

2018 SCORE	CHANGE SINCE 2016	2018 RANK
88	**+10**	**=4**

HIGHLIGHTS

Japan, one of most improved states, increased its score by 10 points since 2016 and shares the rank of fourth in the Theft Ranking for countries with weapons-usable nuclear materials. Japan improved its nuclear security conditions since 2016 by requiring more stringent personnel vetting and a cyber-incident response plan and by ensuring that its requirements for the security of materials in transport meet IAEA guidelines. Japan's nuclear security conditions are adversely affected by large quantities of weapons-usable nuclear materials and by the number of sites where those materials are located.

THEFT RANKING: COUNTRY SUMMARIES

PAKISTAN

2018 SCORE	CHANGE SINCE 2016	2018 RANK
44	**+4**	**20**

HIGHLIGHTS

Pakistan ranks 20th in the Theft Ranking for countries with weapons-usable nuclear materials. Since 2016, Pakistan improved its nuclear security conditions by defining nuclear security responsibilities and by enhancing insider threat prevention. Pakistan could improve by enhancing personnel vetting; by strengthening control and accounting, cybersecurity, and security during transport; and by hosting an international security review. Pakistan's nuclear security conditions are adversely affected by continued increases of weapons-usable nuclear materials, by political stability and corruption challenges, and by the judgment that groups interested in and capable of illicitly acquiring nuclear materials are present.

SABOTAGE RANKING: COUNTRY SUMMARIES

ALGERIA

2018 SCORE	**CHANGE SINCE 2016**	**2018 RANK**
52	**+6**	**42**
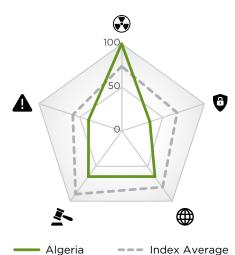

HIGHLIGHTS

Algeria ranks 42nd in the Sabotage Ranking. Since 2016, Algeria improved its law enforcement response training and established a Center of Excellence. Algeria's nuclear security conditions could be further improved by strengthening regulations to mitigate insider threats and by enhancing response capabilities and cybersecurity requirements for nuclear facilities. Algeria could build confidence in its nuclear security conditions by hosting an international review of its security arrangements, as well as by establishing an independent regulatory agency. Political stability, governance, and corruption challenges continue to adversely affect Algeria's nuclear security conditions.

SABOTAGE RANKING: COUNTRY SUMMARIES

ARMENIA

2018 SCORE	**CHANGE SINCE 2016**	**2018 RANK**
78	**+8**	**21**

HIGHLIGHTS

Armenia ranks 21st in the Sabotage Ranking. Since 2016, Armenia improved its nuclear security conditions by strengthening control and accounting procedures and by requiring nuclear facilities to protect critical digital assets from a cyberattack. Its nuclear security conditions could be further improved by requiring reporting of suspicious personnel behavior and by strengthening cybersecurity at nuclear facilities. Armenia's nuclear security conditions remain adversely affected by political stability, governance, and corruption challenges.

AUSTRALIA

	2018 SCORE	CHANGE SINCE 2016	2018 RANK
	93	**+3**	**=2**

HIGHLIGHTS

Australia is tied for second in the Sabotage Ranking. Since 2016, Australia improved its nuclear security conditions by implementing regulations that require updating its Design Basis Threat and a cyber-incident response plan at nuclear facilities. Australia's nuclear security conditions could be further improved by strengthening regulations to enhance personnel vetting measures at nuclear facilities.

BANGLADESH

2018 SCORE	CHANGE SINCE 2016	2018 RANK
54	**+5**	**41**

HIGHLIGHTS

Bangladesh ranks 41st in the Sabotage Ranking. Since 2016, Bangladesh has affirmed its commitment to nuclear security by ratifying the 2005 Amendment to the CPPNM. Bangladesh could improve its nuclear security conditions by strengthening laws and regulations for on-site physical protection, control and accounting procedures, response capabilities, insider threat mitigation, and cybersecurity. Bangladesh's nuclear security conditions are adversely affected by governance and corruption challenges.

BELGIUM

	2018 SCORE	CHANGE SINCE 2016	2018 RANK
	79	-3	20
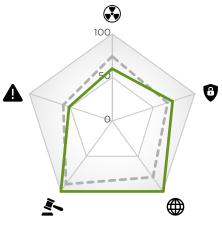

HIGHLIGHTS

Belgium ranks 20th in the Sabotage Ranking. Since 2016, Belgium improved its nuclear security conditions by posting on-site armed response capabilities at nuclear facilities. Belgium could further improve its nuclear security conditions by enhancing personnel vetting to mitigate insider threats and by requiring cybersecurity at nuclear facilities. Belgium's nuclear security conditions are adversely affected by a decline in governance effectiveness and by the judgment that groups interested in and capable of committing acts of nuclear terrorism are present in the country.

SABOTAGE RANKING: COUNTRY SUMMARIES

BULGARIA

	2018 SCORE	CHANGE SINCE 2016	2018 RANK
	84	**+3**	**=17**

HIGHLIGHTS

Bulgaria is tied for 17th in the Sabotage Ranking. Since 2016, Bulgaria improved its nuclear security conditions by taking the radiological consequences of sabotage into account when designing physical protection measures and by requiring both electronic surveillance and a two-person surveillance system in protected areas. Bulgaria could improve its nuclear security conditions by mandating a cyber-incident response plan, improving its insider threat prevention measures, and ratifying ICSANT. Bulgaria's nuclear security conditions are adversely affected by governance and corruption challenges.

SABOTAGE RANKING: COUNTRY SUMMARIES

CANADA

2018 SCORE	CHANGE SINCE 2016	2018 RANK
93	**+4**	**=2**
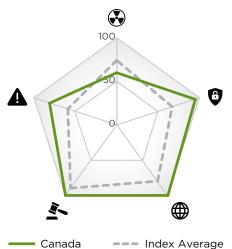

HIGHLIGHTS

Canada is tied for second in the Sabotage Ranking. Since 2016, Canada improved its nuclear security conditions by requiring a cyber-incident response plan for nuclear facilities and by enhancing its insider threat mitigation regulations to ensure that personnel are subject to multiple vetting checks. Canada's nuclear security conditions could be further improved by increasing the frequency of its personnel vetting checks. Canada's nuclear security conditions are adversely affected by the country's large number of nuclear sites.

SABOTAGE RANKING: COUNTRY SUMMARIES

CHILE

	2018 SCORE	CHANGE SINCE 2016	2018 RANK
	68	**+2**	**=32**
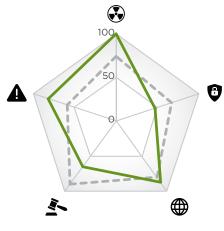

HIGHLIGHTS

Chile is tied for 32nd in the Sabotage Ranking. Since 2016, Chile improved its score by making additional voluntary commitments. Chile's nuclear security conditions could be improved by requiring cybersecurity measures at nuclear facilities and by establishing an independent regulatory agency to ensure compliance with nuclear security–related regulations. Chile's nuclear security conditions could also be improved by requiring updates to its Design Basis Threat, by requiring more stringent and frequent personnel vetting, and by requiring that suspicious behavior be reported.

SABOTAGE RANKING: COUNTRY SUMMARIES

CHINA

2018 SCORE	CHANGE SINCE 2016	2018 RANK
73	**+11**	**26**

HIGHLIGHTS

Since 2016, China increased its score by 11 points, and it is now 26th in the Sabotage Ranking. China improved its personnel vetting, established a Center of Excellence, and hosted an international security review. China's nuclear security conditions could be further improved by requiring updates to its Design Basis Threat, by putting into place cybersecurity regulations, and by boosting insider threat prevention measures. China's nuclear security conditions are adversely affected by the large number of nuclear facilities and by risk environment factors.

HUNGARY

2018 SCORE	**90**
CHANGE SINCE 2016	**+2**
2018 RANK	**=6**

HIGHLIGHTS

Hungary is tied for sixth in the Sabotage Ranking. Hungary enhanced its voluntary commitments since 2016. Hungary's nuclear security conditions could be improved by implementing regulations that enhance personnel vetting and that require the reporting of suspicious behavior. Hungary's nuclear security conditions are adversely affected by governance and corruption challenges.

INDIA

2018 SCORE	**CHANGE SINCE 2016**	**2018 RANK**
56	**+2**	**39**

HIGHLIGHTS

India ranks 39th in the Sabotage Ranking. India's nuclear security conditions could be improved by strengthening on-site physical protection, control and accounting measures, insider threat prevention, and cybersecurity. India also could establish an independent regulatory agency and host an international review of its security arrangements. India's nuclear security conditions remain adversely affected by corruption challenges and the judgment that groups interested in and capable of committing acts of nuclear terrorism are present.

INDONESIA

2018 SCORE	CHANGE SINCE 2016	2018 RANK
72	**+5**	**=27**
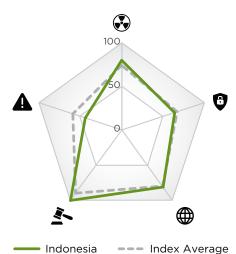

HIGHLIGHTS

Indonesia is tied for 27th in the Sabotage Ranking. Since 2016, Indonesia has improved its nuclear security conditions by making voluntary commitments and by establishing a Center of Excellence. Indonesia's nuclear security conditions could be improved by requiring more stringent and frequent personnel vetting and reporting of suspicious behavior to mitigate the insider threat, by explicitly mentioning the protection of nuclear facilities in its emergency preparedness regulations for natural disasters, and by improving cybersecurity at nuclear facilities. Indonesia's nuclear security conditions are adversely affected by corruption and governance challenges.

JAPAN

	2018 SCORE	CHANGE SINCE 2016	2018 RANK
	91	**+3**	**=4**
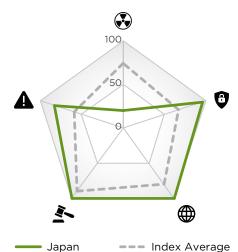

HIGHLIGHTS

Japan is tied for fourth in the Sabotage Ranking. Since 2016, Japan improved its nuclear security conditions by increasing vetting requirements for personnel and by requiring a cyber-incident response plan. Japan's nuclear security conditions could be further improved by requiring a performance-based program that assesses cybersecurity at nuclear facilities. Japan's nuclear security conditions are adversely affected by the large number of nuclear sites in the country.

MOROCCO

	2018 SCORE	CHANGE SINCE 2016	2018 RANK
	58	**+8**	**=37**
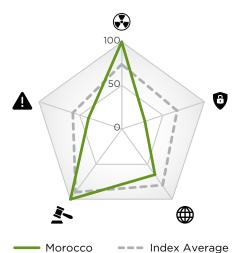

HIGHLIGHTS

Morocco is tied for 37th in the Sabotage Ranking, with a score increase of eight points since 2016. Morocco improved its nuclear security conditions since 2016 by ratifying the 2005 Amendment to the CPPNM. Morocco's nuclear security conditions could be improved by requiring cybersecurity at nuclear facilities, strengthening control and accounting measures, improving response capabilities, and requiring more frequent personnel vetting and constant surveillance of protected areas. Morocco also could host an international security review. Morocco's nuclear security conditions are adversely affected by political stability, governance, and corruption challenges.

POLAND

2018 SCORE 82 | **CHANGE SINCE 2016** -1 | **2018 RANK** 19

HIGHLIGHTS

Poland ranks 19th in the Sabotage Ranking. Poland could improve its nuclear security conditions by requiring updates to its Design Basis Threat, by increasing the frequency of personnel vetting, by increasing surveillance and reporting measures that mitigate insider threats, and by strengthening cybersecurity measures. Poland's nuclear security conditions are adversely affected by decreasing political stability.

RUSSIA

2018 SCORE	CHANGE SINCE 2016	2018 RANK
74	**+3**	**=24**
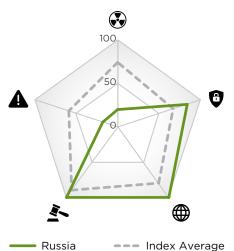

HIGHLIGHTS

Russia is tied for 24th in the Sabotage Ranking. Russia could improve its nuclear security conditions by requiring updates to its Design Basis Threat, by mandating more frequent personnel vetting, and by reporting suspicious personnel behavior at nuclear facilities. Russia could further improve its nuclear security conditions by requiring a cyber-incident response plan. Russia's nuclear security conditions are adversely affected by the large number of nuclear sites; by political stability, governance, and corruption challenges; and by the judgment that groups interested in and capable of committing acts of nuclear terrorism are present.

HIGHLIGHTS

The United States is tied for 11th in the Sabotage Ranking. The United States could improve its nuclear security conditions by requiring more frequent personnel vetting at nuclear facilities. The nuclear security conditions in the United States are adversely affected by the large number of nuclear sites in the country, as well as by political stability and governance challenges.

HIGHLIGHTS

Uzbekistan is tied for 34th in the Sabotage Ranking, with a score increase of seven points since 2016. Uzbekistan improved its nuclear security conditions since 2016 by hosting an international review of its security arrangements. Uzbekistan's nuclear security conditions could be improved by strengthening control and accounting procedures, by enhancing insider threat prevention measures, and by establishing cybersecurity requirements for nuclear facilities. Uzbekistan's nuclear security conditions remain adversely affected by governance and corruption challenges.

THE 2018 NTI NUCLEAR SECURITY INDEX: THEFT AND SABOTAGE

Developed in 2012 with the Economist Intelligence Unit (EIU) and with input from a respected international panel of nuclear security experts, the Nuclear Threat Initiative (NTI) Nuclear Security Index tracks country-level progress on nuclear security and encourages governments to take actions to protect and build confidence in the security of their materials and facilities. The NTI Index is recognized as the premier resource and tool for tracking progress on nuclear security.

The 2018 NTI Nuclear Security Index assesses the security of some of the world's deadliest materials (highly enriched uranium and plutonium that can be used to build nuclear weapons), as well as the security of nuclear facilities, which, if sabotaged, could release dangerous levels of radiation.

The NTI Index ranks 22 countries with one kilogram or more of weapons-usable nuclear materials across a broad framework capturing policies, actions, and other conditions that shape their nuclear security. An additional 154 countries with less than one kilogram of weapons-usable nuclear materials or none at all are assessed across a subset of the framework. This "Theft Ranking"

has been included in every edition of the NTI Index. In 2016, the NTI Index added a third set of countries in a new "Sabotage Ranking." An act of sabotage against a nuclear facility could lead to a dangerous radiation release. This assessment reviews the protection of nuclear facilities against sabotage in 44 countries and Taiwan.

The NTI Index is presented in three formats:

> The **print report**, which contains NTI observations and recommendations, an overview of the EIU methodology, selected data, and country profiles;

> The **website**, www.ntiindex.org, which shows high-level results, country profiles in an easily accessible format, and a detailed description of methodology;

> A **downloadable version of the 2018 NTI Index**, which is available through the website and shows detailed results and data and which provides extended interactive features in an Excel format.

This initiative is led by Page Stoutland, NTI Vice President, and Erin D. Dumbacher, Program Officer, Scientific and Technical Affairs.
